The employer's labour, it is held, is labour of a high, and indeed of a special class, but it is none the less labour, and it must not be confounded in any way with interest on capital (see EARNINGS AND INTEREST FUND). Bagehot has compared (*Economic Studies*, pp. 53, etc.) the modern employer to the editor of a newspaper, or the general of an army, and has remarked in a striking passage that just as the general of an army is "nowadays a man at the far end of a telegraph—a Count Moltke with his head over some papers—who sees that the proper persons are slain, and who secures the victory," so in commerce the "whole" is now "an affair of money and management—of a thinking man in a dark office computing the prices of guns or worsteds." The employer "settles what goods shall be made, and what not; what brought to market, and what not. He is the general of the army; he fixes on the plan of operations, organises its means, and superintends its execution. If he does this well, the business succeeds and continues; if he does it ill, the business fails and ceases. Everything depends on the correctness of the unseen decisions, on the secret sagacity of the determining mind." In a similar way General Walker (*Wages Question*, ch. xiv.), after remarking that the conditions of admission to the employing class are a "long self-initiation, a high premium of immediate loss, and a great degree of uncertainty as to ultimate success," quotes from M. Courcelle-Seneuil's *Opérations de Banque* (p. 392) an enumeration of the qualities which an employer should possess. They are "du jugement, du bon sens, de la fermeté, de la décision, une appréciation froide et calme, une intelligence ouverte et vigilante, peu d'imagination, beaucoup de mémoire et d'application" (judgment, good sense, firmness, decision, a calm and cool temper, an open and alert mind, little power of imagination, great power of memory and of application). Professor and Mrs. Marshall (*Economics of Industry*, bk. iii. ch. ix. § 4, old edition) regard the work of the employer as consisting of two main varieties. "The first is that of organising the production; of determining what shall be made, and how it shall be made; and of deciding where and when to buy and sell. We may," they remark, "adopt an American term and call this *engineering* the business. The second part of his work, which may be called that of *superintendence*, consists in providing for the proper carrying out of his instructions." As the size of the business increases, the employer tends more and more to depute the duties of superintendence to subordinate managers and foremen, and to concentrate his own thought and attention on the *engineering* of the business. To some extent he becomes, as Bagehot has aptly expressed it (*Economic Studies*, p. 59), like a cabinet minister, who may be shifted from one department of state to another in successful reliance on the specialised knowledge of the subordinate permanent officials. He ceases indeed to be personally acquainted with his actual workmen, but he is able to bring his ability and experience to bear more exclusively on the work of management. "The highest class of employers," writes General Walker (*Political Economy*, pt. iv. ch. iv.) consists of those "rarely-gifted persons who, in common phrase, seem to turn everything they touch into gold; whose commercial dealings have the air of magic; who have such power of insight as almost to seem to have the power of foresight; who are so resolute and firm in temper that apprehensions and alarms, and repeated shocks of disaster, never cause them to relax their hold or change their course; who have such command over men that all with whom they have to do acquire vigour from the contact, and work for them as they would not, perhaps could not, work for others, just as great captains (see INDUSTRY, CAPTAINS OF) inspire their armies with a confidence which alone goes far to make them invincible." Below these men come a "much larger" class of a "high order of talent, though without genius or anything savouring of magic"—"men of natural mastery, sagacious, prompt, and resolute in their avocations." Then come the "men who, on the whole, do well, or pretty well, in business;" and lower down come a "multitude of men who are found in the control of business enterprises for no very good reason that can be seen by those who know them." The passages which have been quoted will sufficiently indicate the nature of the work and qualities required of a modern employer, and will explain the high remuneration which he often commands. The average earnings, indeed, of employers seem now to be falling, with the

general diffusion of education and the rapid spread of inventive discovery. But the modern world of business offers greater opportunities for exceptional talent and extraordinary luck than have perhaps ever before been afforded; and the amount of capital and of labour placed at the disposal of a single employer is frequently very considerable. The employer is in a sense the pivot on which the modern world of industry revolves, and the distinctive prominence into which he has been brought in more recent economic literature has conduced to greater definiteness in questions of distribution generally, and in particular in the consideration of three matters of the first importance. The conception that a conflict between labour and capital is involved in the relations of employers to employed is shown to be somewhat misleading; for the employer is in a sense a labourer as well as the employed, and he often does not furnish himself the whole of the capital which he uses. It may even be supplied by individuals who are themselves employed in his own or in other trades. The employer is in reality a middleman, a kind of "buffer" intervening between one set of individuals and another; and, while he may have to bear the first brunt of the conflict, he may also shift part of the burden on to others. The conflict is not then entirely, though it may be partly, between labour and capital; but it is in some degree between one class of labourers and another, who are both interested in obtaining the supply of capital on advantageous terms, and are on the other hand respectively anxious to secure for themselves the larger share of the produce remaining when the claims of capital have been met. Another question, on which considerable light is thrown by the modern analyses of distribution, is the question of co-operative production (see CO-OPERATION). This has sometimes been represented as a question of combining the functions of capital and labour in the persons of the same individuals; but in reality, as General Walker has shown (*Wages Question*, ch. xv.), it involves the elimination of the employer. The workmen wish to take the responsibilities of management upon themselves, and to secure for their own benefit the profits of the employer. They are unable to dispense with capital, even if they entertain such a wish; and they may acquire capital, and become capitalists, without co-operative production. But the object, at which they really aim, is more difficult, for the functions of the employer are very important, and they are making an attempt to undertake them themselves. A third and last question, which is affected by the distinctive importance of these functions, is that of SOCIALISM (*q.v.*) Modern socialist writers represent the products of manufacture as due entirely to the labour of the actual workmen, and therefore as belonging of right to them. They regard the employer as an exploiter and robber of labour, and they consider profits as the outcome of the surplus value (cp. VALUE) of what the labourer produces over what is required for his subsistence. This theory of surplus value is fallacious in other respects; but part of its error may be traced to a failure to distinguish the functions of the employer as such from those of the capitalist as such, and to separate that portion of profits which forms the reward or earnings of the difficult work of management from that which is simply and solely interest on capital.

[In addition to the books mentioned above the student should consult J. S. Mill, *Political Economy*, bk. ii. ch. xv. for the older definition of profits, and the *Boston Quarterly Journal of Economics* for 1888 and 1893 for the controversy raised by General Walker's *Theory of Business Profits*. Reference should be made to Marshall's *Principles of Economics*, bk. iv. ch. xii., bk. vi. chs. vii. and viii., and Sidgwick's *Political Economy*, bk. ii. chs. i. and viii., for the disposition to regard the labour of employers as subject to the laws affecting labour generally. For the tendency to a fall in average profits Leroy-Beaulieu's "*Essai sur la répartition des richesses*, ch. xi. and the *Report of the Industrial Remuneration Conference*, 1887, pp. 4, etc. and 186, etc., should be studied. Pierstorff, *Unternehmergewinn*.—H. v. Mangoldt, *Die Lehre vom Unternehmergewinn*.—Loria, *La rendita fondiaria e la sua elisione naturale* (see also ENTREPRENEUR).] L. L. P.

EMPLOYERS' LIABILITY ACT, 1880, 43 & 44 Vict. c. 42, extends and regulates the liability of employers to make compensation for personal injuries suffered by workmen in their service. At common law the liability of an employer differed with respect to persons in his employment, from that with respect to persons not in his employment (see COMMON EMPLOYMENT, DOCTRINE OF). He was not liable to his servants for the consequences of acts done by fellow-servants in the course of their service. He was, however, liable to them for injuries resulting from the negligence of himself or his partner. Thus he was bound to take reasonable care that his plant and machinery were in a safe condition, and that servants selected by him were competent to their work. But his liability to persons not in his service was far more extensive. He was liable for injuries caused to them by his servants, even when he had not been guilty of any negligence, even when he had expressly forbidden the act producing injurious consequences. The difference of the employer's liability towards his servants and towards the public came to be more oppressively felt as industry was more and more concentrated in huge concerns, such as railways and factories, where the range of choice between employers is limited, and service involves co-operation with a multitude of other "hands" about whose

individual care or dexterity nobody can learn much. The influence of the working class was exerted to obtain a modification of the common law, and the Employers' Liability Act embodies a compromise on the subject. It provides that in five specified cases the workman who has sustained injury through the action of a fellow-workman may bring an action for redress as though he were not in the same employment. Where the injury arises from (1) any defect in the works, plant, or machinery; (2) the neglect of any person superintending; (3) the neglect of any person whose orders the workman was bound to obey when the injury took place; (4) the act of any fellow-servant done in obedience to the rules, by-laws, or instructions (if improper or defective) of the employer or his delegate; (5) the negligence of any signalman, pointsman, or person having charge of a locomotive on a railway, the workman is put on the same footing with the public. The act excluded seamen, domestic servants, and any servant not employed in manual labour. If the injury proved fatal, the right of action passed to the dead man's representative. A new principle with regard to Employers' Liability was introduced by the Workmen's Compensation Act, 1897, by which, in certain employments, workmen had the right to compensation for all injuries received while in the performance of their duties entirely irrespective of negligence. The Workmen's Compensation Act, 1906, extended this right to all persons in service including seamen, but excluding the naval, military, and police services, persons earning more than £250 a year not by manual labour, casual labourers, etc. The conditions of claim are (1) personal injury by accident (see NATIONAL INSURANCE, WORKMEN'S COMPENSATION, etc.), wilful injury excluded except when resulting in death or permanent disablement, but including death or disablement from industrial diseases; (2) the accident must arise out of and in the course of employment. The meaning of this was thoroughly considered in *Dennis v. White & Co.* (1917), A.C. 479. Generally the employer is liable for accidents happening to workman going to or leaving the work premises if the latter is following a recognised way, but he must not be injured through choosing the most dangerous way (*Lancashire, etc., Ry. v. Highley* (1917), A.C. 352); (3) the period of complete disablement must be at least one week; (4) notice of the accident must be given as soon as practicable; (5) medical examination may be required. The serious and wilful misconduct of the workman forfeits all claim. Two Amending Acts were passed in 1918, and in 1917 and 1919 two others provided for additional compensation, but these last were repealed, other additions sanctioned and numerous amendments made by the Workmen's Compensation Act 1923, ch. 42.

W. A. B.

EMPLOYING CLASS. General F. A. Walker, who has contributed greatly to bring into due prominence the functions discharged by the employer (see EMPLOYERS AND EMPLOYED) in the modern world of industry, draws a distinction (*Wages Question*, ch. xiv.) between what he calls a "false employing class" and the "real employing class," to the latter of which alone these functions in his opinion properly belong. The "false employing class" includes, in the first place, those who hire servants who help their employers rather to consume the wealth they have previously produced than to produce fresh wealth. In the second place it includes artisans who are employers on so small a scale that they have only single apprentices; and in the third place it comprises those who are nominally employers, but practically are partners of the employed; and, fourthly and lastly, it contains those who "cling to the skirts" of the profession. The "real employing class," therefore, is the "comparatively small body of men" which is reached by eliminating these various kinds of "false" employers.

L. L. P.

EMPLOYMENT. The number of persons employed in the performance of labour in a country obviously cannot exceed the number of persons capable of labour existing in the country, and, as a matter of fact, it is never for any length of time very much below this number; in all countries the able-bodied unemployed, including not only the men "out of work," but all others who from whatever cause are not engaged in labour, are but a minute fraction of the whole able-bodied population. This is sufficient to show that, broadly speaking, the number of persons employed is regulated in the main by the number of persons seeking employment, or in other words, desirous of earning a livelihood by labour. In a small community, say of ten or twelve persons, living in entire isolation from their fellows, every one would find it easy enough to obtain employment, though he might find that a great deal of employment produced very little food. In a great community where co-operation in the production of wealth is effected by means of exchange, the fact that there is always a certain small proportion of persons seeking employment who are unable to find it is chiefly due to the circumstance that, owing to the division of employments, every kind of production comes to be carried on by people who have by training and experience acquired particular skill in that kind of production, so that when the demand for any one commodity slackens and the number of those who produce it has to be reduced, or at any rate not increased at its normal rate, the persons deprived of this employment are not immediately absorbed in other employments.

EMPTION. The right of the crown, exercised from time immemorial, *to take and buy* "at its need" or "for its use" an indefinite amount of commodities, at such price or on such terms of payment as the circumstances of the case might warrant. It was claimed by Edward I. in 1297 that the king was "free to buy and sell like another"; the advantage to the crown being that such purchases were paid for by tallies, and the amount of the maltolte deducted from the purchase-money (see MALATOLTA). Hall, *History of Custom Revenue*, vol. i. pp. 62, 64; (see also PREËMPTION and PURVEYANCE). H. HA.

EMPTIO-VENDITIO. The Roman contract of sale, or of buying and selling as it is called in order to denote its bilateral character, is formed by one contracting party promising to pay a sum of money or price (*pretium*), and the other party promising to deliver a thing (*merx*) in return. The contract is binding by mere agreement between the parties, neither requiring any formality nor delivery on one side, and so belonging to the class of contracts called consensual. *Arrha* (see ARLES; EARNEST MONEY), a sum of money or other object of value frequently given by a contracting party to afford evidence of the contract, and a security for its fulfilment, is not a requisite of the contract itself. There can be no contract of *emptio-venditio* unless a determinate price, or a price which can be made so (*id certum est quod certum reddi potest*), is made part of the agreement. It was at one time a subject of dispute whether the price must necessarily be in money; thus the Sabinian school of jurists maintained that exchange was a species, and the oldest species, of sale, citing in support of their view the lines of Homer—

"Here touched Achæan barks in quest of wine,
They purchased it with copper and with steel,
With hides, with horned cattle, and with slaves."
(Poste's *Gaius*, III. § 141.)

But the view prevailed that sale was a contract distinguished from barter or exchange by the fact that it had for its object the payment of a sum of money for a thing.

When the contract of *emptio-venditio* is complete the vendor is bound to deliver the thing to the purchaser and the purchaser to pay the price of the thing, but one party cannot be compelled to perform his part if the other will not perform on his side. The obligation of the vendor is not to make the purchaser owner of the thing, but only to give him possession of it. If, however, the purchaser is evicted by a third party who has a superior title, the vendor is obliged to make good to him the loss. Ownership of the thing does not pass to the purchaser until possession of it has been delivered to him and he has paid the price, if it is a ready-money transaction. But though the property has not passed to the purchaser, he is subject to the risk (*periculum*) of its accidental loss, *i.e.* of loss which cannot be attributed to the negligence of the vendor from the time of entering into the contract (*respuit emptori*). This rule is only applicable where there is a specific object appropriated to the contract. If the thing is determined only by its genus or kind, the risk does not attach to the purchaser until the thing has been weighed, measured, or counted, and the purchaser has had notice of this having been done. The purchaser, on the other hand, could claim all accessions and profits of the thing bought arising between the making of the contract and the date of delivery.

The vendor is liable on account of defects in the thing sold, not only when he represents that they are absent, or fraudulently conceals their existence, but, according to the law established by the edict of the curule Ædiles, who had jurisdiction over the market, even on account of latent defects of the existence of which he was unaware. Thus in the Roman contract of sale there is an implied warranty that the thing sold is free from defects. Such, in brief outline, are the main features of the contract of *emptio-venditio*, with which those of the English contract of sale of goods may be usefully compared. E. A. W.

EMULATION, EFFECTS OF, ON SOCIETY. The feeling of emulation may be defined as the desire to excel one's fellow-creatures in any respect whatsoever. It thus admits of infinite variations, produces the most dissimilar consequences, and gives rise to the most contradictory judgments. At its best the spirit of emulation is hardly distinguishable from the desire to achieve greatness or perfection, at its worst the spirit of emulation is hardly distinguishable from envy and uncharitableness. It is, however, an indestructible instinct, which may be schooled but cannot be extirpated, and which is most powerful in the most vigorous natures. Further, it prompts to unceasing effort because it is insatiable. The plain animal appetites may be sated; but emulation incessantly creates anew its object of desire, and, the more it has accomplished, finds the more to be done. Next to the instinct of self-preservation and the instinct of sex, the instinct of emulation has probably had greater effects than any other upon the economic history of mankind. We may consider its effects shortly under three heads: (1) *Emulation in accumulating wealth*, (2) *Emulation in expending wealth*, (3) *Emulation in other directions.*

(1) Emulation in accumulating wealth. The desire to be richer than one's neighbour, to excel him in the power and consideration given by wealth, has been a prime factor in accumulation. Its force has varied chiefly with two

circumstances: with the degree of desire for wealth characterising any given society, and with the proportion of persons who have had a chance of acquiring riches. As to the former circumstance, societies have differed considerably in the value which they assign to wealth in comparison with the other goods of life. The causes of this difference are too many and too subtle to be enumerated here; but among the most influential are different moral and religious ideals, different stages of political development, different degrees of command over the resources of nature. As to the latter circumstance—the proportion of persons who can indulge a spirit of emulation in the pursuit of riches is exceedingly variable. In many societies a small proportion has been above, and a large part has been below, any active emulation in wealth. Sometimes a class of nobles has owed its pre-eminence rather to birth and to military prowess than to riches, and has therefore been less emulous of riches. Often a class of slaves who were legally incompetent to hold property, or of serfs who were not adequately protected by law in the enjoyment of their property, or a class of underpaid free labourers who could barely earn their daily bread and nothing more, has found it difficult or impossible to rise into a more comfortable condition, still more to compete in a rivalry of riches. In such a case the spirit of emulation dies out, because not fed with hope. These remarks might be illustrated from the history of mediæval Europe, in which the emulation of riches appears as a great force only in certain classes and in certain places. But in such communities as our colonies and the United States of America, in which material well-being is the accepted ideal, in which every citizen has hopes of realising this ideal, and in which the command over natural resources is almost unbounded, the emulation of wealth becomes a passion as universal as it is intense, and impels to an amazing economic development.

It is conceivable, indeed, that emulation in the pursuit of wealth might become so intense as to lessen, not to augment, the wealth of society. Thus a community of men so zealous in the pursuit of wealth that they grudged time, trouble, and money for national defence, or for alleviating social evils, might end in subjection to a foreign power or in mere anarchy; and would in either case be reduced to comparative poverty. The same result might follow if emulation in the pursuit of riches led to a universal disregard of commercial integrity or to a neglect of all liberal culture. For there is no instinct which, if left to itself, will not sometimes defeat itself.

(2) Emulation in expending wealth must be taken to mean emulation in expenditure which is not directly productive. The immediate result of such emulation is to lessen wealth. Its ultimate result will depend on many considerations. Thus the wealthy citizens of Rome rivalled each other in expenditure on public works intended for the health and recreation of the public; the burghers of mediæval Europe in building and endowing churches; the nobles of France in display at Versailles. Clearly each of these modes of emulation in expense differed from the rest in its ultimate economic effects, although each was in the first instance non-productive. Again, emulation in expense has different economic results accordingly as it is the emulation of a productive or of a non-productive class. The courtier of Versailles, when he had squandered his fortune, remained poor or had to squeeze his dependents. The American, when he has spent lavishly in Europe, goes back to his country and works yet harder to make another fortune.

(3) Emulation in other directions. Every form of emulation soon or late produces economic consequences. In all ages wealth has followed power, and has been kept by strength. Few nations have got wealth and none have kept it unless there was an emulation of public spirit and military virtue among their citizens. Intellectual emulation, emulation in knowledge and culture, has always stimulated economic and industrial development, and often most effectually when it has been most free from sordid motives. Thus the wealth of modern Germany is directly due to the intelligence of the age of Goethe and the public virtue of the age of Bismarck. Again, the economic condition of the later Roman empire and of the middle ages must have been considerably affected by the emulation of ascetic piety which withdrew so many of the strongest wills and keenest intellects from the world to the cloister. The immediate result was an economic loss, although this may have been partially countervailed by the civilising influence of many monastic bodies. Even emulation in mere sports and pastimes would be found to influence occasionally the economic state of society. F. C. M.

ENCABEZAMIENTO, a contract between the Spanish treasury and the local authorities, by which, after a preliminary estimate of the taxes to be levied, the latter engaged to collect and remit the amount. The first known *encabezamiento* goes back to 1494. E. Ca.

ENCLOSURES. Of "enclosing," *i.e.* the fencing round of land which had previously lain open, whether as common field or as common waste, we hear but little before the 13th century, when the necessity for statutory regulation points to the existence of the custom and of differences between the lords of manors and their tenants. About the origin of those common rights of pasture which play so important a part in the history of enclosures, there has been much controversy; but there is

an increasing consensus of opinion as to the main legal points. Although in strict feudal theory the land belonged to the king as the supreme landlord, the lords of manors came in course of time to be treated as owners of the soil within the manor, who in various ways granted certain rights over it to their tenants. Land might be cultivated by the tenants for their lord or for themselves according to a common system of husbandry, upon certain terms which in many cases included certain pasture rights. These might be (1) rights over the arable land during the year, when under the three-field system it was lying fallow, or during the period between harvest and the sowing of seed; or (2) the right of herding a certain number of animals in a common close; or (3) rights over the wastes and woods belonging to the manor. Whether the lord could from the earliest times enclose at will is a matter of some controversy, but, by the statute of Merton, 1236 (20 Hen. III. c. 4), a parliamentary sanction was given to the enclosure of wastes by the lord of a manor, provided that sufficient pasture was left for the requirements of his freehold tenants; while by the Statute of Westminster, II., 1285 (13 Edw. I. c. 46), enclosure was permitted as against commoners who, without being tenants, possessed pasture rights by a special grant. Until the middle of the 14th century the enclosure of open fields in the interests of tillage continued, and many agreements were made between lords and commoners destroying the common rights over the arable land between harvest and seed-time, and sometimes involving exchange of land. Since such enclosure simply implied the rearrangement of estates, and required the same resident population as before, while the conversion from wood and waste into arable land—another feature of the time—found employment for a larger population, no grievance could arise, and the agricultural gain was great. But owing to the scarcity of labour after the ravages of the Black Death (1349), and the consequent introduction of the lease system, attention was turned to the advantages of pasture farming over tillage. When to these influences there was added, in the 15th century, a desire to promote commercial interests by increasing the supply of wool for exportation, pasture farming was still more widely introduced. Sheep could not be properly reared upon open commons, or upon the small scattered strips, and thus arose the policy of enclosing commons wherever this was possible, either by force, or by voluntary agreement; while the profits of sheep-farming led to the conversion of much arable into pasture land. Tenants were encouraged to consolidate their holdings, to exchange their strips in the open fields for separate farms, and to divide the common pasture with the lord, or in some way to make an agreement with him. The economic advantage of enclosure for grazing purposes was doubtless great, but the social and political dangers were considerable, as was pointed out by many contemporary writers who dwelt upon the depopulation of vast tracts, the diminished sphere for employment, the increase of pauperism, the pressure of evictions, and the loss of customary rights. These evils became more apparent after the dissolution of the monasteries; the earlier agricultural system had been retained on many estates which were confiscated, and thus passed under the new system, while the customary rights of the tenants were held to be overridden by the royal grant. Various statutes were enacted throughout the 16th century for the encouragement of tillage, but it was not until its close that the danger passed away. Edward VI. issued a commission in 1548, to investigate the matter throughout the country, but it was unable to put an end to the social discontent, which found an expression in Kett's Rebellion in 1549. The subject was summarised in the charge read by John Hales at the opening of the commission, and in the *Brief Conceipt of English Policy* (see ed. 1893 under the title of *A Discourse of the Commonweal of this Realm of England*, and article by Miss E. Lamond, *English Historical Review*, 1891). By the close of Elizabeth's reign complaints about enclosures in the interest of pasture farming seem to have ceased; this was partly due to the encouragement given to the growth and export of corn, a course which had a more beneficial effect in reviving tillage than the many statutes passed with that object. From this time onwards enclosure of waste and common fields alike is chiefly advocated in the interest of tillage, not of pasture. In the 17th century many writers advocated enclosures of common fields for the improvement of tillage. Steps were taken for the draining and enclosing of the fens under the direction of Cornelius Vermüyden, a Zealander, while the Earl of Bedford headed an enterprise for enclosing the level which bears his name. In each case the undertakers were rewarded with a portion of the lands thus reclaimed, and this led under the Commonwealth to serious riots on the part of the fen men, whose customary rights were thus set aside. The only other noteworthy feature in the history of 17th-century enclosing, was occasioned by the financial necessities of Charles I., which led him to institute proceedings against those who had encroached upon the royal forests. Heavy fines were imposed upon offenders who had thus enclosed, but it is doubtful whether the king derived as much profit from this source of revenue as he had anticipated.

Until the reign of Charles II. enclosures were effected by agreement between the owners of land and those who possessed rights of common, commissioners being appointed to allot the

lands; the agreement was ratified by the court of chancery, or by royal licence where crown interests were concerned, but from the reign of Charles II. a parliamentary sanction was required. This was only given after the consent of the landlord, the tithe owner, and four-fifths of the commoners had been obtained in favour of enclosure. During the first half of the 18th century enclosing continued slowly; but the rise of a moneyed class interested in agriculture and willing to spend money on agricultural improvements, the increased use of green crops, which raised the profits of tillage, but which could not be profitably worked under the open-field system, the increase of population together with the withdrawal of a large portion from agricultural labour, the difficulty of providing a sufficient food-supply and the danger of dependence upon foreign countries, together with the famine prices produced by the French wars—all these various causes combined necessitated the utmost development of natural resources, and gave an enormous impetus to enclosure both of open fields and of common wastes from about 1760 onwards. The rate of progress is most easily shown by a few figures. In the reign of Anne there were three private bills for enclosure, in that of George I. 16, and under George II. 226, a total of 245 in fifty-eight years, while the sixty years of George III.'s reign show the astounding number of 3209 private bills as well as the general enclosing act of 1801. Unlike the enclosures of Tudor times, those of the 18th century were entirely in the interests of tillage. It is hard to estimate by how much the actual area brought under tillage was extended, since a great many enclosures affected open fields already under cultivation. In 1797, when over 1720 private bills had been passed, the select committee on enclosures reported that of the 46,000,000 acres which England was supposed to contain, about 7,800,000 were uncultivated wastes, while 1,200,000 were in the state of common fields, and it has been estimated that about 4000 parishes, containing open fields, chiefly in the eastern and some of the midland counties, out of a rough total of 8500, were enclosed between 1760 and 1844. Where such enclosures took place with due regard to common rights the gain was great, as the customary course of agriculture, and the difficulty of introducing changes such as machinery or a better rotation of crops, were almost insuperable obstacles to improvement. The enclosure of the wastes was also an economic gain, for in many cases they were previously worthless, the cattle reared on them were of an inferior kind, and, as Sir John Sinclair pointed out in an address incorporated in the report of the select committee of 1795, it was found more profitable to hire land for the breeding of sheep of a more valuable sort than to turn them on to a common for nothing. Nor must it be forgotten that though much suffering was probably inflicted, still it was a social gain to clear some districts of an idle and lawless population—the haunts of thieves who, more especially near the capital, were a public nuisance,—while the draining of vast tracts was not without beneficial effects upon the public health. In many cases the enclosures, as carried out, were hurtful to the labourers, whose cottages had been on the commons, and who had been able to keep a cow, which was no longer possible when enclosure of the open fields and of the waste deprived them of customary pasture rights—often without compensation. The expense of enclosing and the loss of pasture rights is one of the many causes which contributed to the disappearance of the yeomanry during this period. The force of the argument against enclosures lies in the fact that the poor did not in many cases receive compensation for the loss of traditional rights. The enclosure bills did indeed provide that all legal rights should be regarded, and on the whole the commissioners tried to act fairly, but the expense of enclosing was very great; much of the money compensation paid to the commoner was swallowed up in legal expenses, and the poor man was doubtless at a disadvantage in contesting the rival interests of a wealthy neighbour. After receiving reports from various select committees which had communicated with the board of agriculture, parliament in 1801 passed a general enclosing act (41 Geo. III. c. 109) with the object of cheapening and facilitating the process of enclosure, and of thus protecting the interests of the poor. By the act certain general provisions were laid down, which rendered the private acts shorter, though the expense of an application to parliament, and of referring contested cases to a parliamentary committee, still remained.

In 1836 an act (6 & 7 Will. IV. c. 115) was passed by which enclosure of common fields was facilitated. Possessors of common rights to the number and value of two-thirds might nominate commissioners to carry out enclosure of common fields, provided that these were beyond certain distances of the larger towns.

By the general enclosure act of 1845 (8 & 9 Vict. c. 118) this method was extended to the common wastes. An enclosure commission was appointed to deal with land of various kinds in England and Wales. (1) All lands held in severalty, or subject to definite common rights, could be enclosed by the authority of the commissioners without parliamentary sanction. By 15 & 16 Vict. c. 79, the commissioners were, however, forced to submit proposals dealing with land as above described to parliament. (2) All lands over which undefined rights of common existed—and all wastes within 15 miles of London, or within certain distances of other

towns. In such cases the commissioners held an inquiry, and then drew a scheme; all the schemes for the year being presented to parliament in one general act. The commissioners were thus substituted for the parliamentary committee, and it was hoped by the promoters of the measure that examination on the spot would prove a security to the poor, whose interests were directly protected by clauses empowering the commissioners to make allotments and recreation grounds. (3) Village and town greens, as well as the New Forest, and the Forest of Dean, were excluded from the operation of the act.

In 1852 parliamentary sanction was made compulsory for the enclosure of land held in severalty without definite common rights. In 1893 the statute of Merton, though not repealed, was greatly modified; and no enclosure may henceforth be made under that act without the consent of the board of agriculture, which in dealing with such proposals is instructed to carry out the requirements of the Commons Act of 1876, when considering applications for the general enclosure of a common.

ENCROACHMENT. See TRESPASS.

ENCYCLICAL. The encyclical of Pope Leo XIII. on the condition of labour, dated 15th May 1891, which is the subject of this notice, receives its name from its opening words *Rerum novarum*. Here, as in previous encyclicals, notably the one *Quod Apostolici Muneris*, issued in the first year of Leo XIII. (1878), the question of capital and labour is considered mainly in its connection with the recent advances of socialism. It offers us, as M. Charles Périn, emeritus-professor of the University of Louvain, puts it, a "synthesis of the economic order according to the divine laws which regulate human conduct," and it is important as constituting "la vérité catholique pour l'ordre économique," or, as we should put it, an authoritative statement on the part of the Roman Catholic Church on the economics of labour. Its distinguishing feature is the introduction of the principles of justice and charity in the solution of economic questions. The encyclical opens with an allusion to the "spirit of revolutionary change," and the influence of this in the "field of practical economy"; it dwells on the danger of social agitation in the presence of real grievances such as "the misery and wretchedness which press so heavily at this moment on the larger majority of the very poor," and the isolated and defenceless condition of working men, "the callousness of employers, and the greed of unrestrained competition" (*Encyclical Letter*, official translation, p. 4). It then proceeds to examine the remedies proposed on the one hand by socialists, which it condemns, and those which are within the province of the church and state, which it recommends, dwelling in conclusion on self-help by means of association and the importance of a wider diffusion of Christian charity in all human relationships which strikes at the root of all social evils. (1) The socialistic proposals are characterised as unjust and tending to rob lawful possessors, and putting the state into "a sphere that is not its own" (p. 5), and thus depriving the labourer of the liberty of choosing his own employer and using the proceeds of his work. Private property is defended, as against the socialistic recommendation of collective ownership as being "according to nature's law," whilst, "the authority of the divine law adds its sanction" (pp. 7, 8); and, considering the rights of the family as co-ordinate with those of the state "our first and fundamental principle, therefore, when we undertake to alleviate the condition of the masses, must be the inviolability of private property" (p. 11). The pope here falls into the common error of supposing that all private property is excluded in the schemes of modern socialism, whereas it is only instruments of production—private ownership in lands, capital, and machinery—which are to be abolished and become state property, the state directing the process of production, with the disappearance of the wages system in the socialistic state. (2) The encyclical declares inequality as in the nature of things permanent, and points out the methods of the church under these circumstances for remedying the evils arising therefrom. It is the duty of the church to teach and to train men in the principles of social ethics (pp. 18, 19), whereby the poor may learn "to suffer and endure" and to abstain from violent measures in compassing their ends, whilst the rich are taught to "religiously refrain from cutting down the workman's earnings, either by force, by fraud, or by usurious dealing" (pp. 13, 14). The church, too, in her institutions, as in the past, guards the "patrimony of the poor" by means of "deposits of piety" flowing from Christian self-sacrifice and charity. (3) The state as the organ of distributive justice protects each class with a view to the common good; all well-constituted states are bound "to provide those bodily and ex-

ternal commodities *the use of which is necessary to virtuous action.*" "It is only by the labour of the working man that states grow rich. Justice, therefore, demands that the interests of the poorer population be carefully watched over by the administration" (pp. 22, 23). Sunday rest, and the protection of health and the prevention of excessive labour of children and females being among the subjects demanding state interference, as also the restraint of the disturbers of social peace, "to save the workman from their seditious arts, and to protect lawful owners from spoliation" (p. 25). On the wages question Leo XIII. proves himself to be "le pape des prolétaires" in demanding of the state protection against unscrupulous employers, who under a semblance of free contract deprive the labourer of his due. Distinguishing between this theory and facts, between normal wages and fair wages, he points out that the working man, having nothing but his wage to fall back upon for a livelihood, is bound to come to terms with the master even to his own disadvantage, unless he is protected by the state or boards of conciliation authorised by the state to secure the rights of both parties of the contract, and this on the equitable principle that "each one has a right to procure what is required in order to live" (p. 28). (4) In the last place the pope recommends association and corporation as after the pattern of Christian confraternities under the fostering influence, though without undue controlling power, of the state as means of mutual support and protection against encroachments; but it is by a return to Christian faith and charity alone that the evils of society can be cured in the end,—so concludes the encyclical which thus becomes what Anatole Leroy-Beaulieu, in his appreciative study of *La Papauté, le Socialisme, et la Démocratie*, calls "un code de morale sociale" (see pp. 66, 67). But also, as the same writer points out, so far from coming into conflict with the principles of political economy, as now understood, the encyclical is on a line with its most recent developments (*ib.* p. 50), adding to the moral factor the religious forces without which selfishness and greed would be the only prompting motives of economic action.

[Charles Périn, *L'Économie Politique d'après l'Encyclique sur la condition des ouvriers*, Paris, 1891.—*Note sur le juste Salaire d'après l'Encyclique rerum novarum* by the same.—Henri Joly, *Le Socialisme Chrétien* under the head, *Les dernières écoles.*—Anatole Leroy-Beaulieu, *Papacy, Socialism, and Democracy*, trans. from the French by B. L. O'Donnell, Chapman and Hall, 1892, gives the text of the encyclical in an appendix.—Henry George, *On the Condition of Labour*, 1891.—Also W. T. Stead, *The Pope and the New Era*, 1890.] M. K.

ENDORSEMENT. See BILL OF EXCHANGE.

ENDOWMENTS. Adam Smith in a well-known passage[1] has written strongly on the subject of endowments. In his eyes they tend to hinder capital and labour from taking their natural course. In certain professions, notably that of holy orders, the existence of endowments, to encourage and support those who are preparing for them, has attracted large numbers of men who would otherwise have carried their energies into different fields. Hence a depression of incomes in those professions, for the number applying for employment in them is greater than the work requires. A change in circumstances since Adam Smith wrote has robbed his particular instance of much of its force, for the endowments in question have, as a rule, been diverted, and the growth of population coupled with well-defined religious revivals has greatly increased the work of the clergy. But Adam Smith goes farther, and maintains that, tested by experience, endowments have failed to secure any good object. The universities, he says, are largely endowed, and have failed to make any great additions to the learning of the country, which is no more than might have been expected *à priori*, for the motive to exertion being removed by the certainty of income independent of it, exertion itself would tend to diminish. Dr. Johnson,[2] though not accepting Adam Smith's conclusions, put the same argument in a popular form when he says, "Why, sir, we would all be idle if we could."

As the growing tendency of the present time is to employ endowments for the advancement of learning or the furtherance of education, it may be worth while to examine the reasoning at greater length. The objections to endowments may be put in the form of a dilemma—either a given result is worth having, and then the public are ready to pay for it, or the public is not ready to pay for it, and then it is not worth having; in the one case endowments are superfluous and cripple energy, in the other they are wasted. It will be observed that this argument is based on the assumption that the public are the best judges in such matters. To this it is objected that although the common exchanges of life may safely be left to competition, and the public are able to judge of quality in the matter of tea, sugar, etc., the case is very different when learning and the higher forms of education are involved. The public, or at least the English public, are not qualified to discern good and bad in such matters. The demand for books and teaching in the highest subjects is never likely to be sufficient to make it worth any one's while to write upon or teach such subjects as a profession, and many persons who have the ability and the taste requisite are powerless to pursue the subjects for want of

[1] *Wealth of Nations*, bk. i. chap. x.; cp. bk. v. chap i., art. ii.

[2] Boswell's *Life of Johnson*, A.D. 1776.

means. In such cases endowments, it is argued, may profitably be used to provide the means of subsistence for men who are in reality great public benefactors. Certain chairs, for instance, at the universities need endowments to support their holders in the absence of a sufficient number of students ready to pay fees to maintain their teacher. Certain forms of study and research are never likely to be sufficiently remunerative to provide those who pursue them with the means of livelihood, and must consequently be endowed. Outside these special cases it is readily granted that endowments, by making men independent of their exertions, tend to weaken their industry; but unless these particular subjects are endowed, the level of learning and of teaching is likely to be lowered, for the subjects studied and taught will be those, and those only, which bear directly on practical life. The question is not, perhaps, one which admits of a final answer. The enthusiasm which leads a man to adopt an unpopular subject may in many cases be trusted to keep him industrious, independently of reward. A certain habit of mind is observable in those who are mainly supported by endowments, a tendency to delay publication, an excessive self-criticism, a want of definiteness—all these go far to postpone, if not to destroy the realisation of the results of their work. It has been remarked that in this country a large amount of the best work has been done by men who have a regular employment, and with whom the advancement of learning is a secondary occupation. J. S. Mill, *e.g.*, wrote his principal treatises in the intervals of his work as a clerk in the India House. Grote's *History of Greece* was the work of a banker, and other instances might be quoted. In the great majority of cases a certain amount of teaching is a help and not a hindrance to research. The most successful use of endowments has, perhaps, been in cases where they have been employed to support men who have already made themselves a name in a subject, and who have been set free from the necessity of working for their daily bread at some occupation which they have hitherto practised. But the method of distributing endowments is distinct from the question of their inherent advantages or drawbacks. In German universities endowments are, as a rule, only a part of the income of a professor, the proportion that he earns by fees being greater or less as his subject is popular or the reverse.

Apart from the encouragement of research, endowments are largely used to forward the higher education of the country. The universities expend large sums annually in scholarships to attract students; and fellowships, being now largely used as prizes at the end of a university course, are additional inducements to students to undertake it. The consideration of poverty enters but little into their distribution. Here again a question may be raised as to the wisdom of such a policy. Studies, it will be urged, which are not self-supporting in the sense of attracting students by their own charms, are not worth supporting at all. Others will hold that studies which do not bear directly on practical life (in German phrase are not "bread studies") have a value of their own, of which the public are not the best judges, but which make it worth while to support them by endowments; and that while studies which are a direct preparation for business may safely be left to themselves, it is the interest of a country to preserve others from extinction. We have in England no logical principle applied to the graduation of studies or their mutual relation; but the tendency of the present day is to use endowments largely to facilitate the passing from the lower to the higher grades. Instances are not wanting of those who by their means have risen from elementary schools to high places in the universities. In practice it must be owned that endowments often (1) cheapen education for a class who can perfectly well afford to pay for it, by providing plant, etc., for the great public schools and the universities; (2) enable poor men to live at a needlessly expensive rate, which is determined by the standard of comfort set by more wealthy companions.

Two subsidiary points may be mentioned.

1. The system of confining the advantages of endowments to certain localities is being gradually modified. It is argued that migratory habits and facilities of communication have greatly lessened the reality of local divisions; that, on the whole, every locality gains by the process; that waste is avoided, and the supply of endowments made to correspond more nearly to the number of persons qualified to make a good use of them.

2. The abolition of any poverty qualification, mentioned above, has been severely criticised. It may be defended on the ground that it is almost impossible to make such a qualification real. Poverty is difficult to define, and it is impossible to formulate any system of compensation as between ability and want of means. Moreover, on the whole, the present tendency to distribute endowments by competition, making ability and not poverty the test, tends to raise the whole level of education, and so to benefit the poor; whilst the spur of poverty is sufficient to ensure industry, and the temptations to idleness which go with wealth are, in the great majority of cases, strong enough to prevent members of the wealthy class from competing successfully.

[Mill, *Pol. Econ.*, bk. v. chap. xi. § 15.—Turgot, *Fondation et Fondations*, Œuvres, vol. iii., ed. 1808.] L. R. P.

ENEMY GOODS. In early times the pro-

perty of the enemy, wherever found, was liable to capture. By custom and treaty the harshness of this rule has been modified, and the modern practice may be summed up as follows:—(1) Movable property belonging to an enemy state may be appropriated; immovable property may be occupied but not alienated. (2) Movable private property is liable to contribute to the support of the invading army, contributions and requisitions being levied for that purpose; immovable private property is exempt from appropriation. (3) Private property on the high seas is liable to capture except where it is on board a neutral vessel. (4) Private property within the jurisdiction of the belligerent is not as a rule liable to capture.

[See CONTRABAND, DECL. OF LONDON, DECL. OF PARIS.—*International Law*, by W. E. Hall, Oxford, 1890. Many writers advocate the exemption of private property at sea from capture. In some modern wars this principle has been followed. See De Laveleye, *Du Respect de a Propriété Privée en Temps de Guerre.*—Bluntschli, "Du droit de Butin," *Rev. de Droit International*, tom. ix. and x., and articles in the same review by M. Vidari, tom. iii. (1871).—M. Gessner, tom. vii. (1875), and the reports presented to the Institute of International Law, tom. viii. (1875).] J. E. C. M.

ENFACED PAPER OR RUPEE PAPER. The title applied by stock exchange custom to Indian government securities, the interest on which is payable in silver rupees. The capital also is expressed, or enfaced, on the certificate as being so many silver rupees, the value of which in the London market varies according to the value of silver in relation to gold. The word "enfaced" might almost as well be applied to any other kind of security, inasmuch as all have more or less on their face a description of the security represented. Custom, however, has lent the word simply to those Indian rupee stocks which bear interest at 4 per cent and upwards, the interest of course being payable in silver, and subject to an increase or decrease in sterling value according to the value of silver in the bullion market. The Indian government cannot borrow so easily or at so low a rate of interest in silver as it can in gold, the mass of investors having been repelled by the possibility of fluctuations in the sterling value of the interest receivable. At the same time it has been thought well by Indian statesmen to avoid accumulating a large sterling debt, lest the Indian government should some day encounter a heavy fall in the value of silver, which would compel it to tax the natives of India to the extent that more rupees would be required to provide each pound sterling. A. E.

ENFACEMENT is the converse to endorsement (see BILL OF EXCHANGE). The word does not appear to have been in use before the year 1858, when the Indian Government decided to pay the interest on the Indian home debt in London by means of drafts at sight on India, and issued the following notification:—

"When holders of notes in Calcutta desire that the interest thereon should be made payable by bills issued in London, they must present their notes at the office of the Accountant-General to the Government of India, where an enfacement will be made on each of the notes in question as follows: *Interest payable in London by draft on Calcutta* (or Madras, as the case may be)."

[Geo. Clare, "Stock Exchange Securities," *Journal of the Institute of Bankers*, vol. xiv. p. 226.]

ENFANTIN, PROSPER, called "Le Père" (1796-1864), was born at Paris and died in the same city. Having first been, in conjunction with BAZARD (*q.v.*), a leader, he became, after Bazard retired, the sole chief of the St. Simonians, and did his utmost to promote the success of that economico-religious sect, up to the date of its fall. Commencing as a devotee of mysticism, Enfantin finally adopted the doctrine of "free love"; this brought him into trouble with most of his fellow-religionists. He was condemned on 28th August 1832 by the assize court of the department of the Seine, in company with Charles Duveyrier and Michel Chevalier, to a year's imprisonment and a fine of 100 francs, for having assisted, without previously obtaining permission, in the formation of an association consisting of more than twenty members, and in the promulgation of articles injurious to public morality.

The penalty was before long commuted, and Enfantin made his way to Egypt, where he studied the question, now long since settled, of piercing the Isthmus of Suez.

Subsequently, after remaining for several years at Tain (Drôme), he returned to Paris, and was appointed, in 1845, a director of the first company for constructing a railway from Paris to Lyons.

After the revolution of 1848 he founded, in conjunction with Charles Duveyrier, the journal *Le Crédit*, which continued to appear till 1850. Finally Enfantin became the administrator of the second Paris, Lyons, and Mediterranean Railway Company—a post which he continued to hold till his death.

Before the fall of the St. Simonian School, Enfantin published, in conjunction with others, *Doctrine de St. Simon, Exposition*, 2 vols. 8vo, 1830-32; afterwards, in his own name, *Économie politique et Politique*, 1 vol. 8vo; *Morale*, 1 vol. 8vo, etc. After the dispersion of the St. Simonian School, Enfantin wrote a volume, *Colonisation de l'Algérie*, 1843, 8vo, in this, across a web of original ideas and among passages which show deep historical study, may be traced the opinions of the early socialists.

His works were collected by zealous disciples, and printed in 9 vols. 8vo, 1866-73. A. C. f.

ENFRANCHISEMENT, the liberation of the serf from his forced astriction to his lord's estate, and his forced labour for his lord's behoof. Though not liable, like the slave, to be sold from master to master, or to give his whole time to his master's work, the serf was still practically chained to the estate to which the right to his labour was legally appendant, and he could still be compelled to his work by whips or imprisonment at his master's will. There was a third strand in his bondage—his subjection to his lord's civil and criminal jurisdiction, which left him defenceless against arbitrary exactions, and therefore operated often quite as injuriously on his economic position as the other two, but it was not felt to involve the same personal indignity as they did, and the serf is commonly considered enfranchised when he is released from them, although he may continue subject to his lord's general authority. Enfranchisement has proceeded perhaps more generally from moral than from economic motives, but it has usually justified itself immediately, and always eventually, by bringing with it a decided economic advance. The pinch of serfdom was the forced labour; when that was commuted to a money payment the astriction to the estate fell away of itself, for want of any practical reason for enforcing it longer. But though the astriction to the spot was less grievous to individuals—except indeed among the Russian peasantry, whose chief complaint, Haxthausen tells us, always was that it restrained their idle propensity to rove—it was always most pernicious to the progress of the community, because it stopped all division of labour, limiting occupations to the little round of work in a rural village, and preventing the rise of towns, and trade, and manufactures. Russia consequently, where serfdom was only abolished in 1861, is still, in spite of the acknowledged industrial gifts of its people, little more than a vast nation of crofters, every man half indifferent agriculturist and half indifferent tradesman; and even in agriculture, though it is now one of the largest exporters of grain in the world, its system of husbandry continues almost primitive, and there has never arisen a modern farming class with the requisite skill and capital for practising improved methods. The ill effects of the forced labour were always more directly obvious. The serf who got a small holding to cultivate for his own support, but was obliged to give three days a week (the usual quota) to his lord's work, could neither do justice to his own fields nor to his lord's,—not to his own because he was called away from them precisely when he most required to be upon them, and not to his lord's because he gave his labour reluctantly, sometimes with bitter ill-will, and he had no interest except to give as little of it as he dared. His holding is sometimes called the wages for his labour, and his labour the rent for his holding; but that was a bad form of wages, because it repressed instead of encouraging the labour it was supposed to reward, and this was a bad form of rent, because it interfered with the proper cultivation of the land which was supposed to yield it. Serf labour, like all discouraged labour, was habitually indolent. Professor R. Jones was informed by the English engineer who superintended the making of the road from Hamburg to Berlin in 1830, that the Prussian free labourers he employed broke thrice as much granite in the day as the Mecklenburg serfs, and that when he tried to animate the latter by mixing them in the same gangs with the former, the experiment failed because it had exactly the contrary effect of making the free labourers slacken their exertions to the bond pace (*Distribution of Wealth*, p. 52). The peasants on Russian state lands, whose labour rents were commuted into money rents long before the universal emancipation, are much more energetic, enterprising, and prosperous than the recently-emancipated serfs (Thun, *Landwirthschaft u. Gewerbe in Mittelrussland*, p. 43). Roscher quotes two authorities who made personal investigations into the relative industrial capacity of serf and free labourer in the same communities, and one—Jakob—counted two free labourers equal to three serfs, while the other—V. Flotow—counted three free labourers equal to four serfs (*System d. Volkswirthschaft*, i. 152). The difference is still more strikingly shown by Hanssen, who mentions that on the estate of Rixdorf in E. Holstein, where labour rents were commuted in 1780, it required ninety-two horses and seventy-five men to work the home farm before the commutation, and only thirty-six horses and fourteen men after it (*Aufhebung der Leibeigenschaft in Schleswig u. Holstein*, p. 39). Usually, too, though the labourers were fewer the harvest was greater. The eminent Danish statesman, Count J. H. E. von Bernstorff, finding he could not with serf labour make his property yield enough to pay the taxes, freed the serfs in 1767, paid them wages for the work they did, and obtained a net return of £150 a year (Sugenheim, *Gesch. d. Aufhebung d. Leibeigenschaft*, p. 500). Storch mentions that he nearly tripled the production of his estate by this enfranchisement, raising his product of rye in the ratio of from 3 to 8⅓, of barley from 4 to 9⅓, and of oats from 2⅔ to 8 (*Cours d'Économie polit.*, iv. 306).

In factory work it has been generally found impossible to employ serf labour remuneratively at all. Haxthausen found some old serf factories in Russia during his visit, but they were in a very languishing condition, and most of the Russian manufacturers, though they had generally begun with their unemployed domestic serfs, and then changed them for some of their agricultural serfs who were stronger, had all in the end to learn the same secret—that the

Russian was a bad workman when he worked on compulsion, but became an excellent workman when he worked for hire. Force extorts but the minimum of effect; it is hope that draws out the maximum. They consequently set their serfs free, imposed a small annual charge as commutation duty, and engaged them in the ordinary way for wages (*Russian Empire*, i. 110), precisely as Storch says had been done in Moscow factories as far back as 1805 (*Cours*, iv. 30).

Enfranchisement has occasionally resulted ill, but that has been due either to moral defects in the particular individuals or groups enfranchised, or to the excessive burden of the compensation dues or other conditions of the enfranchisement. Freedom necessarily contains the possibility of doing worse as well as the possibility of doing better. J. G. Kohl repeatedly came across villages in Little Russia with free peasants living on one side and serfs living on the other, and he always found that while the most prosperous inhabitants of the village were among the free peasants, so also were the most miserable (*Reisen im Innern von Russland*, ii. 300). On the Zamoiski estates in Poland, enfranchisement seems to have had a curious double action; it tripled the production on the proprietor's fields (Cox, *Travels in Poland*, i. 22), but it had a bad effect on the serfs' own, because they became drunken and neglected their work (Burnett, *Present view of Poland*, 106). The great Russian emancipation of 1861 is the most notable example of the natural and good operation of enfranchisement being vitiated by concomitant economic and social conditions. J. R.

ENFRANCHISEMENT OF LAND FROM COPYHOLD AND SIMILAR TENURES, History of. The enfranchisement of copyhold lands in England has passed through three stages. It is necessary for the purpose of tracing its history to consider (1) enfranchisement at common law; (2) voluntary enfranchisement under the copyhold acts 1841-1887; (3) compulsory enfranchisement under the copyhold acts 1852-1887.

1. Enfranchisement at common law. Copyhold lands and lands of similar tenure must, according to the law of England, be "parcel" of a manor, or in other words, wherever lands are held by copy of court roll, the freehold in those lands is in other hands than those which hold the "copy." The process of enfranchisement unites, in the hands of the copyholder, the freehold and the copyhold interest. It is evident that nothing short of the whole freehold interest will suffice to clear the land of all its copyhold incidents, and therefore an enfranchisement at common law may be effected "by any lord entitled to the manor in fee simple, or who has a power to enfranchise or a power of sale and exchange," but it cannot be effected by a lord with a more limited interest or less extensive powers. An enfranchisement, therefore, before the year 1841, was carried out through a conveyance of the fee simple of the copyhold in question, from the lord of the manor to the tenant for an agreed price. The fact that the tenant himself had only a limited interest in his copyhold estate did not affect the validity of the enfranchisement, which would enure for the benefit of the estates of those who succeeded him. Unless special provisions were inserted in the conveyance, three somewhat unexpected results would follow from the enfranchisement. (1) That the mines and minerals would pass from the lord to the copyholder; (2) that the copyholder's rights of common in the "waste" of the manor would be extinguished; (3) that all mortgages, or other incumbrances affecting the lord's title, would affect the enfranchised lands in the hands of the quondam copyholder. It will be readily understood that the difficulties attending enfranchisement, under such conditions, rendered the conversion of copyholds into freeholds a cumbrous and costly process.

In 1802 we find, in the Land Tax Redemption Act, provisions which enable owners of limited estates in manors to make enfranchisements for the purpose of obtaining money for redeeming the land tax. This appears to be the first indication of the principle subsequently worked out in the copyhold acts.

2. In the year 1841 was passed the first of the acts which "provide the means for an adequate compensation for the rents, fines, and heriots payable to the lords of manors, in respect of lands of copyhold and customary tenure, and for facilitating the voluntary enfranchisement of such lands, and for improving such tenure." This act created a body of commissioners called the copyhold commissioners, now the land commissioners, whose consent and approval must be obtained to enfranchisements made under the act. Under this protection the legislature felt itself enabled to give authority to the lord of any manor, "whatever may be his estate or interests therein," to enfranchise "all or any of the lands holden of his manor," and to any tenant, "whatever may be his estate and interest," to accept such enfranchisement. The consideration was payable in money, but by agreement such money might be made payable at a future time. Whenever the lord who enfranchised had a limited interest only, the money, so soon as it was paid over, was to be invested, and to be subject to the same trusts as those affecting the manor to which the enfranchised copyhold had previously belonged. It was now enacted that any rights of common belonging to the land enfranchised should continue to be attached thereto after it had become freehold, and that the lord's right to

mines and minerals, under the enfranchised land, should not pass upon the enfranchisement unless expressly commuted. Upon payment of the sum payable for enfranchisement, the tenant was authorised to charge it upon the lands enfranchised, with all the powers and rights of a first mortgagee. Finally, the title to the enfranchised copyholds was to be separated for ever from the title to the manor.

By this act, therefore, three of the main impediments to general enfranchisement were done away with; for (1) it was no longer necessary to obtain the conveyance from an absolute owner; (2) it was no longer necessary expressly to reserve the lord's mines and minerals and the tenant's rights of common; and (3) the enfranchised copyholder had nothing to fear from any encumbrances clogging the estate of his former lord. But enfranchisement still remained a matter of agreement, and could not be forced upon an unwilling lord. Amending acts are a sure sign that a statute is not a dead letter, and the Copyhold Act of 1841 was followed by those of 1843 and 1844. The act of 1843 provided that the consideration for enfranchisement, which under the act of 1841 was a lump sum of money, might in future be paid wholly or in part by an annual rent charge, or might take the shape of a conveyance of lands forming part of the manor to which the enfranchised lands had previously belonged. The act of 1844 extended the last-mentioned provision to any lands which, in the opinion of the copyhold commissioners, could be conveniently held with the manor to which the enfranchised lands had previously belonged, although themselves not belonging to such manor.

These three acts of 1841, 1843, and 1844, constituted a short code under which voluntary enfranchisement could be satisfactorily carried through. But it was not until 1852 that compulsory enfranchisement became possible for either lord or tenant.

3. The system of compulsory enfranchisement, which was inaugurated by the Copyhold Act of 1852, was applied in the first instance to those copyholds only to which a new tenant was admitted on or after 1st July 1853, or in other words, so long as an existing estate in the copyhold continued to subsist, neither lord nor tenant could force an enfranchisement upon tenant or lord. But six years' experience of the act of 1852 enabled the legislature to extend its provisions to all copyholds whenever the last admission had been made to them.

The key-note to the system of compulsory enfranchisement is valuation of the lord's interest by independent valuers, under the supervision of the copyhold commissioners. The difficulty which compulsory enfranchisement had to deal with was the amount of compensation to be paid to the lord in respect of fines and other sources of profit to which, if the copyhold interest continued, he would become entitled at uncertain intervals, and which, upon enfranchisement, required to be turned into money once and for all. Without going into the meaning as to "the lord's fine," it may be sufficient to say that such fines are payable when a new tenant is admitted, that is, entered upon the court rolls as the person holding the copyhold tenement "according to the custom of the manor." Originally the price given to induce the lord to accept the new tenant, the fine, was in its nature arbitrary and uncertain, and depended in each manor upon the custom of that particular manor. But the courts of the king had, at an early date, established that the courts of the manorial lords could not by custom give efficacy to unreasonable fines, and in course of time developed the working rule that "two years' improved value of the land, after deducting quit-rents," was the maximum amount which the lord of a manor should be entitled to receive upon the admission of a new tenant.

How then does the act of 1852 meet this problem? In the first place all fines and other manorial dues, payable upon the admission, which under that act supplies the opportunity for enfranchisement, are to be discharged before any further step is taken. Then the valuers, or their umpire, or the single valuer agreed upon by lord and tenant, must ascertain the value of the manorial rights now exercised for the last time. The valuation, when made, must take the form of an award, must be confirmed by the copyhold commissioners, must be registered at the office of the commissioners, and must be entered upon the court rolls. The amount of the valuation, failing agreement, is to be paid by the tenant in a lump sum, if he has claimed the enfranchisement; but if the lord has insisted on the change of tenure, the compensation will, in the absence of express agreement, take the form of an annual rent-charge. In either case the "enfranchisement consideration" is a first charge upon the lands enfranchised.

Two provisions of this act are noteworthy, as showing the caution with which the legislature introduced compulsory enfranchisement. Firstly, power is given to the lord to buy out the copyholder compulsorily if he can show, to the satisfaction of the commissioners, that his "mansion-house, park, garden, or pleasure grounds," may suffer from the tenant's enlarged powers of dealing with the lands which are ceasing to be copyhold. Such a power might well be granted to the lord if the tenant threatened to open a marl pit or cut down standing timber upon land with which he could not so deal whilst still a copyholder. Secondly, if it be found at any time that the person who

purported to enfranchise was not the lord at all, it is provided that the true lord is to recover the consideration for the enfranchisement from the person who wrongfully received it, instead of forcing the tenant to pay the money again and look to the wrong-doer for compensation.

Valuers acting under the Copyhold Act 1852 must take into consideration "facilities for improvement," as, for example, the possibility that the land may become building land, and the hindrances to such improvement, as, for example, the probability that it will not become building land for some years.

The Copyhold Act 1858 is to the Copyhold Act 1852 what the Copyhold Acts 1843 and 1844 are to the Copyhold Act 1841. It contains such improvements as the working of the principal act had suggested. Thus for the deed of enfranchisement specified by the act of 1852, which the parties would execute, was substituted an award of enfranchisement to be made by the copyhold commissioners; owners of at least two-thirds of the value of copyholds held in undivided shares, obtained the power to insist on an enfranchisement whatever their co-tenants might desire; and one form of certificate of charge was provided for securing the payment of consideration money, compensation money, and expenses of enfranchisement, as the case might be.

Speaking generally, the costs of a voluntary enfranchisement are paid in manner agreed by the parties, or, failing agreement, are paid as directed by the commissioners; while the costs of a compulsory enfranchisement are to be paid by the party who has insisted upon abolishing the copyhold tenure.

In 1887, after an interval of thirty years, an act was passed "to make further provisions for enfranchisement" of copyhold lands. An important provision of this act is that the steward of any manor, when a new tenant comes for admission to a copyhold, must hand to such tenant a notice stating that he is entitled, if he desires, to enfranchise the copyhold. A further provision of great importance prevents the lords of manors from making grants of portions of the "waste" of their manors. Again, the tenant may pay the compensation for an enfranchisement on which he has insisted by means of a rent-charge of 4 per cent of the amount of compensation. Finally, the compensation to the steward of the manor is fixed by a schedule to the act, and the land commissioners are directed to "frame a scale of compensation" such as "will facilitate enfranchisement." The scale published in conformity with this act comprises a table in which is calculated the number of years' annual value payable to the lord, according to the age of the tenant, as compensation for the loss of future fines. An act, consolidating all earlier legislation, was passed in 1894, under which both compulsory and voluntary enfranchisements are now effected. The powers formerly in the hands of the land commissioners are now exercised by the Board of Agriculture, whose consent must be obtained both for voluntary and compulsory enfranchisements. The latter are effected by an award made by the Board, and the Board directs the valuation for compensation. The party demanding the enfranchisement must bear the expense. The tenant has in all cases the choice of paying the compensation either in a gross sum or as an annual rent charge, but when the lord is the compelling party, the compensation is paid as a rent charge unless the tenant desires otherwise.

Enfranchisements on crown lands, church-lands, and university and college lands, are the subject of special statutes.

[Brown, *Copyhold Enfranchisement Acts*, 1888.—Scriven, *On Copyholds*, 6th edition, 1882.—Elton, *Law of Copyholds*, 1898.—See COPYHOLD.]

ENGLISH EARLY ECONOMIC HISTORY.—In the present state of historical investigation, it is difficult to give a complete account of the development of political economy in England. Many writers have devoted attention to the subject, and reached important conclusions, but comparatively little use has been made of the vast stores of material relating to the later middle ages, and the rise and fall of the mercantile system. Particular movements have indeed been carefully investigated, and we are not without indications of the general course of development. To take an illustration from mathematics, certain points on the curve of development have been ascertained; we have some idea of its shape; we know also that the English curve is only one of a large family of curves, other members of which may be found on the continent. But of its direction between the points ascertained, and of the differences between it and others of the same class, we know little.

The subject may be best approached by considering the influence of the mediæval church. Before the conversion of the Anglo-Saxons to Christianity there was little commerce, but Christian merchants resorted to England while the inhabitants were still pagans, and so brought them into contact with a more highly developed economy than their own. Many of the principles which we find in mediæval economic teaching may probably be traced back to this or an earlier period; for example, the idea of money as a *pledge*, which exercised an important influence on economic doctrine in England far into the 17th century. Neither the condemnation of avarice nor hostility to usury was peculiar to Christianity. The social system of the middle ages, greatly modified as it was by Christian teaching, had its foundations in a pre-Christian state of society. But making

every allowance for the influence of ideas and customs derived from earlier times, the fact that the new religion obtained a firm hold on the population while industry and commerce were still in their infancy, is of primary importance in tracing the development of political economy. Early economic institutions and laws are stamped with the teaching of the church. Subsequent modifications of doctrine are largely the outcome of the struggle, on the part of the church, to guide or control new economic forces as they gradually came into operation. To follow rightly the course of development it is first of all necessary to understand the position of the church with regard to trade and industry.

From the earliest times the church had had forced upon it the duty of applying the principles of Christianity to social life. Outside Palestine the earliest converts were found in the busy trading centres of Asia Minor; and the first persecutions were probably due to the fact that the new religion threatened various trading interests, and tended to the overthrow of the existing social system (Ramsay's *Church in the Roman Empire*, pp. 12, 199, 200, etc.). But the church was hostile to the ordinary usages of the world only in so far as they were in conflict with the ideal of Christianity, which supplied a standard by which all actions in the economic sphere could be tested. Everything inconsistent with the profession of Christianity was condemned, and uncompromising obedience to its precepts was enjoined. The process of applying Christianity, in changing or widely differing social conditions, went on in the earlier centuries of the Christian era and throughout the middle ages. The work of the church was not so much to introduce new principles of action as to test those already known, assimilating those which were not hostile to Christianity, and giving them new significance when considered in the light of the Christian faith.

The pursuit of gain as an end in itself was obviously inconsistent with Christianity, and the condemnation of avarice in every form is one of the most striking characteristics of the teaching of the church. This may be regarded as the fundamental principle of mediæval economics. Its different parts are so closely interwoven with each other that we can without much difficulty reconstruct the whole system from any one of its elements. Closely bound up with the condemnation of avarice was hostility to many methods of acquiring wealth which have since been adopted by civilised communities, and chief amongst those forbidden methods was USURY (*q.v.*), the objection to which extended to all forms of investment for the sake of gain. But the general teaching of the church would have had comparatively little influence but for its wide and far-reaching application of the principle of association. The interests of the individual were subordinated to those of the community. The duty of helping those in need, and the brotherhood of all Christians, were insisted on. It was this side of the teaching of the church (see CHRISTIANITY AND ECONOMICS; CHURCH, THE MEDIÆVAL) which accelerated, if it did not initiate, the formation of gilds and other associations, and ultimately led to the creation of the elaborate system of the middle ages for the regulation of trade and the restraint of competition. Insistence also on a just or reasonable price for commodities, the approximate determination of which was easier in this early stage of industrial development than it would be in modern times, led to numerous laws framed with a view to realising that object. It may be noticed as evidence of the hold which mediæval doctrines obtained, that the expression "just price" (JUSTUM PRETIUM), interpreted to mean that price which most closely approximated to cost of production, was used as a synonym for "cost price" as late as the end of the 16th century.

(*Vide* R. RECORDE'S *Grounde of Artes*, 1543, frequently reprinted and edited by Dr. Dee, John Mellis, Robert Norton, and others.)

The early hostility of the church to usury was based on the biblical records and on the authoritative declarations of the Christian fathers and the councils. Had the church maintained its original attitude there can be no doubt that its influence would have seriously hampered economic development. It became impossible, however, to regard with hostility many of the new methods of acquiring wealth which appeared with the extension of trade and commerce, and thus began one of the most interesting movements of thought of the middle ages, viz. the adaptation of the principles of Christian teaching on the subject of lending and borrowing to the needs of a changing environment. This process begins about the twelfth century. The canonist writers, on the one hand, endeavoured to separate the essential from the non-essential elements of the doctrine of usury, and to apply it to mercantile transactions, strengthening their position by appeals to ARISTOTLE'S doctrine of the barrenness of money, the conception of *natural law*, and other arguments; while, on the other hand, merchants and traders, anxious to escape the "censure of usury," appear to have been not unwilling to submit to decisions which, on the whole, did not seriously hamper freedom of investment. *Bonâ fide* credit agencies, bills of exchange, loans for trading purposes, the payment of interest whenever the lender could show that the loan would result in "certain gain lost" or "actual loss incurred," rent charges, partnership, loans on bottomry, and other expedients for securing a return for the investment of capital, were gradually approved by the canonist writers, and the outcome of the movement was that the doctrine of usury was stripped

of everything likely to prove an obstacle to the practice of ordinary business methods.

Such was the course of movement on the continent. But for the present we are only entitled to say that there was a general similarity between English and continental opinion during this period. No doubt many passages may be quoted from English statutes which appear to be suggested by the canon law. The influence of the church was great, and the trading classes would not lightly risk excommunication for the sake of gain. "Goods lost, nothing lost; credit lost, much lost; soul lost, all lost," is an old proverb; and even as late as 1486 Pope Sixtus IV. thought it worth while granting to the inhabitants of the Channel Islands "the help and authority of the church by interdict, anathema, and other forms of censure, for the repression of piracy, robbery, and violence" (*Materials for history of the reign of Henry VII.* (Rolls series) i. 280). The ordinary teaching of the church, whatever may have been its practice, was hostile to avarice and covetousness (*vide*, for example, the homily in *Ashm. MSS.* 750), and occasionally the influence of the GILDS (*q.v.*) may have been favourable to the rule of the CANON LAW (*q.v.*) [*Ordinances of the Gild of St. Leonard, Lynn*, Toulmin Smith's collection, p. 50]. The usury laws also were enforced and had the support of the trading classes (*Liber Albus*, ed. 1861, 318, 319, 339). But such evidence enables us to say only that there was a general similarity, which indeed we should expect, between England and the continent; and in the development of economic doctrine the points of difference are of equal if not of greater importance. The backwardness of investigation prevents us from dealing with the latter with any completeness of detail. The following, however, may be noted. Neither the canon law nor the civil law was received in England as authoritative "except educationally, and as furnishing scientific confirmation for empiric argument." (Stubbs, *Lectures on Mediæval and Modern History*, 307.) The canonists, however, claimed that "a suit might be brought in the ecclesiastical courts for every matter which was not cognisable in the courts of secular law, and for a great many matters which were so cognisable" (*ib.* 316), and there was a long conflict on the subject. The system of rent charges was not generally prevalent in England, and *montes pietatis* were never established (see MONT DE PIÉTÉ). An attempt to introduce the latter was made without success, by Gerard MALYNES, early in the 17th century (*Lex Mercatoria*, 1622). The economic legislation of the 14th and 15th centuries was largely empirical. In the regulation of foreign trade especially, and in the organisation of the customs, the measures adopted were mainly determined by the fiscal necessities of the government, and we can see very early the tendency to subordinate trade to the exigencies of foreign diplomacy (*e.g.* in the relations between England and Flanders) which became so prominent a feature of later commercial development. Councils of merchants were summoned by Edward I. and Edward III. to advise with them on questions of trade (see Rymer, *Foedera* (1821) vol. ii. pt. v. 1057). The general impression we get from a study of the legislation of this period and from such arguments as are recorded in the Rolls of Parliament, is that many of the measures adopted were tentative and experimental. To understand therefore the economic ideas of the time we must examine closely the statutes and institutions in which they were embodied. Such were the statutes regulating wages and prices, the organisation of the crafts, the staple system, restraints on the exportation of bullion, statutes of employment, and usury laws. We may notice the following points: (1) The movement of thought on the subject of usury was slower in England than on the continent. (2) Financial methods well known on the continent were not introduced into England until comparatively recent times. The discussion, therefore, of various credit agencies which did so much to modify continental opinion was scarcely possible in England. (3) The impression prevailed —with what reason it is unnecessary here to discuss—that the staple system, while imposing certain regulations on all merchants alike, was not unfavourable to freedom of enterprise. (4) Money, so far from being subject to the same laws as other commodities, was supposed to be essentially different from them. It was, in fact, not a commodity at all, but a *pledge, a medium of exchange*, circulating under the authority of the prince or commonwealth, its value determined solely by that authority. The first appearance of those forces which were destined to break up the mediæval system should be noted. In the reign of Richard II. we have the first navigation act; then the beginning of various trading companies, especially that of the merchant adventurers (see ADVENTURERS, MERCHANTS; NAVIGATION LAWS).

We are now in a position to trace the subsequent development of economic doctrine in England. The reign of Henry VII. was of great importance in the economic history of the country, and its industrial and commercial progress very soon brought about far-reaching changes in economic ideas. From the middle of the 16th century onwards there were few years in which some book or pamphlet was not published on subjects of economic interest, and such works may be reckoned by thousands. It is difficult to draw a sharp line of division between economic and non-economic publications. We shall, however, keep as closely as possible to the main line of development of doctrine, and in a later section indicate the relation to it of other currents of thought.

English statesmen and writers in the middle

of the 16th century had to face the most difficult economic problems which could possibly be submitted to them. The mediæval system for the municipal control of trade was unsuitable for the regulation of the new economic forces which the extension of the domestic system, especially in the woollen industry, brought into operation. The decay of tillage, and the growth of enclosures, appeared to threaten the country with the evils of depopulation, as well as a great increase in poverty. The social changes induced by the reformation seemed to be equally momentous. In relation to foreign trade, the loss of Calais inflicted a death-blow on the staple system, and the withdrawal of the privileges of the Hanse merchants injured the interests of a section of English merchants, although it left the way clear for the development of a national foreign trade by the merchant adventurers. In the growth of industry and commerce these difficulties were inevitable. There must have been great disturbance and loss to some classes, but in time the country would have settled down to the new conditions. The evils, however, of the period of transition were aggravated by a currency problem of the first magnitude. The debasement of the coinage under Henry VIII. and Edward VI., coupled later on with the influx of the new silver from the American mines, led to a rise of prices without parallel in the history of the country. The evils of the debasement were felt especially by the landed interest, the government, and the working classes. It is important to keep these facts in mind, for they formed the subject-matter of the earliest economic literature. One treatise—the *Briefe Conceit of English Policy*, attributed to William Stafford, and published in 1581, but really written by John Hales about 1549 (*Eng. Hist. Review*, vi. 284)—deals with these questions as a whole, and sums up the aims of the government at this time. The writer shows a clear insight into the causes of the high prices; his work is invaluable as a storehouse of information, and in it we have a broad outline of the theory of the balance of trade, which was elaborated in the following years. The *Briefe Conceit*, however, scarcely enables us to trace distinctly the relation between the opinions which have already been described, and later economic doctrine. To do that we must go to the history of the merchant adventurers.

With the growth of their trade, the merchant adventurers naturally adopted means of avoiding the transmission of bullion, such as bills of exchange, which had long been in use for certain transactions. Until the middle of the 16th century all went well, but then the fluctuations in the ratio of exchange between London and Antwerp, and other places, brought into prominence the usurious aspects of bill discounting, and the opponents of the merchant adventurers attributed the rise in prices to their practices. It was commonly believed that it was within the power and the exclusive right of the government to fix the rate of exchange, and thus determine the prices of commodities. We cannot here detail the circumstances which gave rise to this theory. It must suffice to say that when it arose it was not altogether absurd; there was much in the ordinary practice of merchants to give some show of truth to the theory; and it was closely bound up with the doctrine of usury. From the middle of the 16th century until late in the 17th it was advocated in pamphlets, and pressed upon the attention of the government, which was really uncertain how to act. It was the basis of the charge of usury, which was one of the most usual arguments against the merchant adventurers (*vide* the *Treatise on Exchange*, 1564, printed in Milles's *Customers Replie*, 1604), and the economic world was divided into two opposite camps — the bullionists, represented by the advocates of the Staple System (*q.v.*), and the newer mercantile school represented by the merchant adventurers and their supporters. In his economic works, nine in number, though only five survive, Thomas Milles, head customer of Sandwich, undertook the defence of the staple system, and denounced the monopolising tendency of the merchant adventurers. In his *Customers Apology* (1601), we have a curious anticipation of Adam Smith's canons of taxation, and one of the earliest instances of the claim for free trade based upon the theory of natural rights (cp. Report from the Committee on the Free Trade Bills, 1604, *Journals of the House of Commons*, ii. 218-221. The monopoly of the merchant adventurers was "against the natural right and liberty of the subjects of England.") The attacks on the company called forth John Wheeler's *Treatise of Commerce* (1601). Wheeler was secretary to the merchant adventurers, and his statements are not free from bias and inaccuracy, but his book is a good defence of their policy and aims. Wheeler's reply to Milles provoked another attack from the latter, in the *Customers Replie* (1604), in which he added to the force of his own arguments by reprinting the *Treatise on Exchange in Merchandise and Merchandising Exchange* mentioned above. We need not, however, follow him through his other works. His mantle fell on Gerard Malynes, who was more moderate in his views, and had more knowledge and experience than Milles. Meanwhile, the East India Company had obtained their charter, and in it a clause allowing them to export bullion. In consequence of this, the controversy on the foreign exchanges, the brunt of which had been borne by the merchant adventurers, was turned against the East India Company. Matters were also complicated by the introduction of a new element into the discussion, viz. the relative advantages of joint-stock and regulated companies for

carrying on distant trade, the East India Company being an example of the former, and the merchant adventurers of the latter. It must also be pointed out that the state of trade in the reign of James I. caused, reasonably or unreasonably, much anxiety; and the currency, the privileges of the trading companies, the price of wool, the navigation acts, etc., formed from time to time the subject of government inquiry. We shall deal with these issues later on; they are mentioned now to show how impossible it becomes with the growing complexity of economic questions to separate the writers of this period into well-defined groups. Early in the reign of James I. there was some possibility of the revival of the old machinery for the regulation of the foreign exchanges. The controversy burst into new life in 1622. To meet the charges brought against the East India Company, Thomas MUN published, in 1621, his *Discourse of Trade from England to the East Indies*, which was devoted partly to showing the advantages of the exportation of bullion. It is interesting to notice, however, that as yet Mun had not entirely broken away from the old school, for in this work he approved of the statutes of employment. Edward MISSELDEN, for some time deputy governor of the merchant adventurers at Delft, had long devoted attention to the woollen trade, and in 1622 he published his *Free Trade, or the means to make Trade flourish*. In this work he discusses the reasons for the backwardness of the English cloth trade, and defends the company organisation. But for some cause he appears to have been not unwilling to disarm the opposition to the merchant adventurers and to turn it against the East India Company; and amongst the causes of the decay of trade he enumerates the exportation of bullion by the latter.

Now Malynes had already, in his earlier pamphlets, found a sufficient cause not only for depression of trade, but for all social evils, in the theory of the foreign exchanges which we have already noticed. To his mind the only remedy likely to prove efficacious was the revival of the staple system. Naturally, therefore, he thought Misselden completely mistaken in the causes to which he attributed the supposed decay of trade, and he approved of a joint-stock company for the East India trade. He therefore replied to Misselden in his *Maintenance of Free Trade* (1622), in which he reiterated his theory of the foreign exchanges. This pamphlet was almost immediately followed by his great folio *Lex Mercatoria*, in which he expressed the same views.

We may digress for a moment to point out that we probably owe to Malynes the introduction of the word "capital" into England. At the beginning of the 17th century this word was unknown, or at any rate not in use in England. In his *Lex Mercatoria*, Malynes endeavours to popularise the Italian and Dutch method of keeping accounts, and he describes the *capital* or *stock* of a merchant as consisting of the goods in his warehouse, his ready money, debts due to him, houses and lands in his possession, and his "plate, apparell, and household stuff." "Capital," as used by Malynes, was derived from *capitale*, very numerous instances of which may be given from continental treatises on mercantile law.

To return to the controversy of 1622, Malynes's work was not allowed to pass unquestioned. In 1623, Misselden replied in his *Circle of Commerce, or the Ballance of Trade*, in which he completely refuted Malynes's theory of the foreign exchanges, and, taking up the defence of the East India Company, pointed out the advantages of the exportation of bullion, and sketched the theory of the balance of trade. Malynes again replied, but his theory had been completely demolished. Thus the mercantilists not only arrived at a truer doctrine of international trade, but in doing so destroyed a theory with which the old views with regard to usury were closely bound up. In 1628 Thomas Mun further developed the argument for the exportation of bullion in the *Petition and Remonstrance of the East India Company*, which was republished in 1641. Meanwhile, Sir Ralph MADDISON had been devoting attention to the subject. He had sat, with Mun and others, on the royal commission of 1622, though for some reason his name was omitted on the reappointment of the commission in 1625. Under the commonwealth and the protectorate he was regarded as a great authority on currency questions. He gave a clear statement of the theory of the balance of trade in *England's looking in and out*, 1640, a work which was reprinted in 1641, and again, with a few verbal changes and additions, in 1655 under the title of *Great Britain's Remembrancer*. Maddison, however, holds a middle position between Malynes and Mun, for his views on currency and the foreign exchanges appear to be based upon the works of the former. Mun incorporated the arguments of the *Petition and Remonstrance* in *England's Treasure by Foreign Trade*, published in 1664, some years after his death, and this work became the chief bulwark of the mercantile system in England. It passed through many editions and exercised an influence almost incredible at the present time. Thus the great system of which we find the general outline in the *Briefe Conceit of English Policy* was furnished with an economic basis. But before we describe the principal characteristics of Mun's work, it is desirable to trace the development of the other lines of thought which his book brought to a focus.

The economic writers of the 16th and the 17th centuries agreed in maintaining that the unrestricted operation of the motive of self-

interest led to disorders in the state, and that an efficient system of industrial and trade organisation was necessary to direct the economic activities of the country into the right channels. They set before themselves a definite object, the "public good," by which they meant the creation of a "commonwealth," in which the various trading interests should be so balanced as to secure the greatest economic efficiency of the various elements consistent with the self-sufficiency of the nation as a whole; and considerable prominence is given to this idea as an "economic motive" in the works of the best writers. Thus Mun distinguishes between three sorts of gain, (i) that of the commonwealth, which was sometimes the merchant's loss; (ii) that of the merchant, "which he doth sometimes justly and worthily effect, although the commonwealth be a loser"; and (iii) that of the king, "whereof he is ever certain" (*England's Treasure*, etc., p. 64), but he had previously stated the rule that, in commerce, "private gain was ever to accompany the publique good" (*ib.* p. 3). The pursuit of the public good, interpreted in the sense given to it above, was a real force in the economic world, and the suppression of a trade "hurtful to the commonwealth" was generally approved. Taking the mercantile system at its best, it shows a distinct advance on mediæval ideas in the substitution of the wider interests of the nation for those of the craft or the municipality. On the other hand, it must be admitted that the majority of the writers show little or no consciousness of a high national aim. The "hurtful" trade generally happened to be that of a rival company, a dependency, or a neighbouring nation. The mercantilists differed too from the *laisser faire* school in the views they held on the relation of economic questions to religion, politics, and other subjects. Economic interests could not be isolated. Prosperity was the result of various economic, political, and religious forces mutually interdependent. Thus Sir William Temple remarks of Holland: "The trade of this country is discovered to be no effect of common contrivances, of natural dispositions or situation, or of trivial accidents, but of a great concurrence of circumstances," amongst which he enumerates the immigration of aliens, the constitution and credit of the government, liberty of conscience, security of life and property, and the interest of the people in their government, as well as causes of a more strictly economic character (*Observations upon the United Provinces*, Collected Works, 1723, i. 65). One of the mercantilist tests of economic prosperity separates them so sharply from more modern schools, that it deserves to rank as a fundamental principle of their teaching. This was the quantity of the precious metals which the country contained. A thorough examination of mercantile doctrines in relation to the circumstances of the time does not exonerate the writers from the charge of confusion of thought on this subject. There is no evidence that this led to any evils in the ordinary economic life of the community. But on foreign trade as a whole, and on the popular estimation in which different branches of foreign trade were held, it had enormous influence: "The ordinary means to increase our wealth and treasure," says Mun, "is by Forraign Trade, wherein we must ever observe this rule: to sell more to strangers yearly than we consume of theirs in value." The economic pamphlets of the period abound with similar statements. They certainly mean that the benefit of foreign trade is measured by the excess in value of exports over imports, and that branches of commerce which can not bear this test should be discouraged, or even suppressed altogether. Although there is no "historical justification" for this doctrine, we can see how it arose. We may dismiss the idea that the mercantilists thought "wealth" and "money" identical. No man could believe more firmly than Gerard Malynes in the necessity of securing a constant influx of bullion, yet we owe to him the first clear definition of capital in the English language. His book, bound up with Dafforne's *Merchants' Mirrour*, one of the most complete works on book-keeping then in existence, was very generally used as the chief authority on mercantile affairs. The strongest advocates of the theory of the balance of trade were successful business men. Mun was one of the ablest East India merchants of his time. There is no trace of any confusion of wealth with money in their business transactions, and they exported bullion like any other commodity. We must therefore seek some other explanation of the fallacy. Although the old bullionist theory of the foreign exchanges had been refuted, the writers of the 17th century could not free themselves from the conceptions on which it was based, and such works as Roberts's *Mappe of Commerce* (1638), or even Alexander Justice's *General Treatise of Monies and Exchanges* (1707), in which the ratios and methods of exchange between London and other trading centres are given in great detail, show that international transactions were still carried on in much the same manner as under the staple system. The king's Exchanger (*q.v.*) had disappeared, but the cambists and goldsmiths performed his functions with great profit to themselves. Communication between one country and another was slow and difficult; credit agencies were little developed; and in such circumstances the old view of the precious metals was not easily eradicated. It remained firmly fixed in the popular mind. It was more natural to regard the changes which lapse of time, expanding commerce, and the rise in prices had brought about, as modifications of an old theory, than to invent a new

and more accurate one. The strict analogy drawn by the writers of this period between the business transactions of an individual and the foreign commerce of the nation as a whole gave to the old theory a greater persistence. The fact that during the 17th century imports and exports were a fairly good test of international indebtedness had the same influence. It may also be pointed out that English imports consisted of a greater proportion of luxuries, such as spices, wines, silks, and fine linen, and a smaller proportion of necessaries and raw materials than at the present day, while bullion was indispensable for trade with the east, in the then backward state of English manufactures. So the mercantilists tried to keep down the importation of commodities which in their opinion sapped the vitality of the nation, and to secure the bullion which they required (see MERCANTILE SYSTEM).

We are now in a position to understand the attitude of the school of which Mun was the typical representative to the economic questions of the 16th and the 17th centuries. It is obvious that the mercantilists were not likely to take much theoretical interest in the finely-drawn distinctions of the canonist writers on the subject of usury. Theological influences were not strong in this country; and true to the English tradition, the mercantilists preferred expediency to metaphysics. It is probable that the views of the later canonists were never thoroughly popularised in England. During the reformation period there was much controversy, and towards the end of the 16th century many pamphlets were written, amongst which we may mention Nicholas SANDERS'S *Briefe Treatise of Usury* (1568), Thomas WILSON'S *Discourse of Usurie* (1569), Rogers's translations of the works of M. P. Cæsar and N. Hemming (1578), H. SMITH'S *Examination of Usury* (1592), and Miles MOSSE'S *Arraignment and Conviction of Usury* (1595). But the development of trade and commerce, which at an earlier period might have imparted great vitality to such discussions, took place subsequent to the reformation, and though the influence of the contending schools may be traced in the legislation of the period, English writers appear to have regarded the subject mainly as one of practical expediency. Malynes was indebted to Wilson's *Discourse* for some of his arguments and illustrations, but even those who were willing to prejudice the merchant adventurers by attributing their "usurious" practices to the influence of Rome, were on the whole hostile to the prohibition of usury. The doctrine was important only as a support to an erroneous theory of the foreign exchanges, and, with the refutation of the latter, interest in the former disappeared. The CULPEPERS, father and son, Thomas Manley, and other writers from time to time engaged in the controversy. The average English position is stated in Sir J. CHILD'S *Brief observations concerning Trade and the interest of Money* (1668). In *The Interest of Money mistaken, or a treatise proving that the Abatement of Interest is the Effect and not the Cause of the Riches of a Nation*, published in the same year, an attempt is made to correct a current popular fallacy. Mun's view was the ordinary view of the time; favourable to usury, he held that "this course in the rich giveth opportunity presently to the younger and poorer merchants to rise in the world, and to enlarge their dealings; to the performance whereof, if they want means of their own, they may and do take it up at interest: so that our money lies not dead; it is still traded" . . . "usury and trade rise and fall together" (*England's Treasure*, etc. 144, 146). With the views of LOCKE and the other writers of the end of the 17th century we shall deal in a later section.

While the theoretical discussion of interest and usury attracted few writers, the constitution of the trading companies assumed great importance in economic controversy. This was inevitable, for at the beginning of the reign of James I. the whole of the foreign trade of the country except that carried on with France was monopolised by one or another of the companies, and they were one of the most important factors in economic development from the beginning of the 16th to the middle of the 18th century. During the period which we are now considering, viz. from the beginning of the 16th century until the publication of Mun's work (1664), there were, roughly speaking, two stages in the controversy on this subject. In the first stage the Merchant Adventurers Company was the most powerful of the associations then in existence. The controversy naturally took the form of a struggle between the merchant adventurers and those who looked for a solution of the great problem of the organisation of foreign commerce to a revival in some form of the staple system. The first stage may be said to terminate with the free-trade bills of 1604, to which reference has already been made. After the failure of these bills the position of the companies was assured, although hostility to them in one form or another is a most marked feature of 17th century history, and Cromwell tried the experiment of a free and open trade with the East Indies in 1653. The case for the merchant adventurers is stated with great moderation in an anonymous treatise, *Towchinge the Multitude of Marchantes for ventinge of Eng. clothes* (*Rawl. MSS.*, D. 23). After pointing out that the government should provide for only so many merchants "as have acquaintance, and as have polycy and understandinge to trade together to buy up all clothes vendyble for marchant venturers, and to carry them together, by one consorte of Marchants, unto one certen marte," the writer goes on to say·

"I do also suppose yt it is not profytable for the realme to have a multytude of Marchante Venterers, yt have but small stockes, and thereby they have but small credytt, and suche marchantes can not convenyently tary for theyre sales, nor yet keepe necessarye order." The opponents of the companies, as we have seen, claimed free trade as their natural right and inheritance, but "this generall lybertye . . . would cause a greate confusion, and a greate dysorder to growe in the ventyng of Englyshe clothes, whereby would follow yt or Englyshe clothes would be soulde at a lower pryce, then is fytte for the benefytte of or realme, and strange wares for England would be boughte at a dearer pryce than is convenyent for our commonweale of Englande." On the other side the arguments, in addition to the one mentioned above, were very strong. It was urged that freedom of trade would lead to the increase of wealth and shipping, the more equal distribution of wealth, and the increase of revenue. It was further maintained that the company organisation was no longer necessary, and that if trade were free, commerce might be extended beyond its present limits.

The growth of the East India Company, which was incorporated on the last day of the 16th century, led to the second stage of the controversy. The merchant adventurers were what was called a regulated company; the East India Company was organised on the joint-stock principle (*vide* Companies). Now many people who objected to monopoly in every form were of opinion that the former was less injurious to trade than the latter, and the East India Company had a long and arduous struggle before it won the victory. The conflict had to be waged with the Turkey Company, whose trade in raw silk was ruined by the enterprise of the East India merchants, with those who were alarmed at the exportation of bullion, with the free traders and interlopers, and with those who thought the East India trade disastrous to the growth of the navy. The last-mentioned cause of hostility gave rise to a sharp controversy between Sir Dudley Digges and an anonymous writer, J. R., in 1615. "The East India men," says the latter, "not able to furnish those places they resort to, keep out others from coming amongst them. . . . Besides, how tedious and costly they, and all other companies, make it to their own associates, whereas out of orders, and cause of upholding their trade, men can neither dispose of their own as they would nor have the benefit under a long time? How private do they and other companies make it when . . . how plentifully soever the commodities are brought in and at what advantage soever they buy them, they will be sure to keep up the price, either by sending most part of the commodities abroad, or else by buying all others into their hands?" Digges's reply, *The Defence of Trade*, on behalf of the company, probably derived more force from the position of the author than from the arguments he employed. The company of course could point to the fact that the prices of eastern produce had fallen since their incorporation, and they made as much as possible of this argument, which was further elaborated by Mun in his *Discourse of Trade to the East Indies* (2nd ed. 1623). The company and its advocates, however, appear to have evaded rather than answered the objections of their opponents. No one during the 17th century wanted freedom of trade in the modern sense of the words. It was universally recognised that some form of regulation was necessary, and most people would have chosen the company organisation. The object of the free-trade bills (1604) was not to break down all restraints on free competition, but to throw the companies open to all who cared to join them, imposing by government authority such charges as were necessary to keep up their official establishments in foreign ports. It was the monopoly of the companies which roused the hostility of the outsiders. The companies seem to have imagined that when they had shown the advantages of the trades they monopolised, and proved the necessity for regulation, they had answered their opponents. Mun wrote *England's Treasure* long before the end of the struggle. But his book did good service to the company. Their exportation of bullion could no longer be urged as a reasonable ground of objection, and the East India trade had been proved to be favourable to the growth of the navy.

It has become a commonplace to regard the navigation acts as the natural outcome of mercantile doctrine. The political circumstances of the time, the growth of foreign commerce, and along with it the necessity of providing adequate means for its defence, and the foundation of colonies, showed the great importance of a powerful navy. The economic writers of the period were naturally influenced by the general movement, and they urged the encouragement of trades, especially the fisheries, which were favourable to the growth of the navy. The vast increase in the wealth of the country, and the greater ease with which large sums can be raised by taxation, have made inapplicable to the present age the practical suggestions of the mercantilist writers. But the importance of a mercantile marine as a naval reserve is felt as keenly now, especially in times of danger, as in the period under discussion. The economic arguments, however, by which the navigation acts were defended, give to those measures a peculiar character. There were navigation acts in the reign of Richard II. Those, however, we need not discuss. It is the series of acts commencing in the reign of Elizabeth, and culminating in the great act of

the Long Parliament (1651), re-enacted at the restoration, to which we shall devote our attention (*vide* NAVIGATION ACTS). The Merchant Adventurers Company, which as we have seen played such an important part in the development of the mercantile system, early associated itself with this naval policy. Thus we find them advocating it in 1551. One of their *Articles and Allegations . . . against the Hanse Merchants* (*Rawl. MSS.* C. 394, ff. 37, 38) was to the effect that whereas they "have and by all waies do indevoure themself to supporte and maignteigne to their power, the whole Navie of this your Ma^tes realme, by fraightinge and ladinge of the same and to contynue a greate nomber of your Ma^tes subjects in maroners crafte: the said Esterlinges to the intollerable decay therof, both inwardes and also outwardes do contynuelly lade, fraight and shippe their goodes, wares and marchandises in foreyne and strange bottomes, and vessells." They then point out the loss to the country of the money paid for freight and insurance. This is an argument which recurs over and over again, and it is evident that the writers of the period attached great importance to it. Mun argues that we must "use our own shipping and so get the merchant's gains, insurance and freight," though generally speaking "commerce should be free to strangers to bring in and carry out at their pleasure" (*England's Treasure*, p. 22). The influence of the navigation acts was made the subject of government inquiry, and much attention was given to the subject throughout the 17th century. *The Advocate* (1651), which was published to allay the discontent caused amongst some classes by the act of 1651, and which we find reflected later on in the writings of Roger COKE, shows how these acts were regarded as part of a general scheme of economic policy. This work points out that it was the design of the Dutch "to engross universal trade that so they might poiz the affairs of any other state about them and make their own considerable." The advantages which Holland has over England are then enumerated. Their ships are built, provisioned, and convoyed at less cost than those of England. Their "cheapness of freight," which is an advantage of 20, 15, and 10 per cent over England, has forced English merchants to hire and freight Dutch ships. They employ a "great stock"; give "prudent care to their manufactures"; make the negotiation of commercial treaties their "interest of state,"; impose small customs; encourage inventions; have a low rate of interest; facilitate their trade by a bank; and pursue an enlightened land policy. Some "unalterable laws in manufactures" are enunciated. (1) There is no manufacture or artificial commodity which cannot be transplanted into any country. (2) All manufactures, if they are of a certain goodness, are of a certain value and price also. (3) Two persons selling or making commodities of a like goodness, he shall have the preference of the market that will sell them the cheapest. And so in international trade. (4) The cheapness of manufactures and artificial commodities depends upon the plenty and cheapness of the raw material, and upon the price of labour. The price of labour depends upon the price of victuals, house-rent, and other things necessary. The Dutch have no extraordinary advantages over England. Such as they are, they are due to the carelessness of England. By trade alone can wealth and shipping be increased, and so the power of any nation sustained. A commonwealth can only be enriched by reducing into general practice the courses used by private men for that purpose. Hence England should encourage native manufactures; and weaken Dutch shipping. Commodities must be imported from the immediate places of their production or growth, or as near as conveniently may be. Exports, native or other commodities, must be sent to the farthest market, where they will yield the greatest price and have the quickest sale. After these reasons, it is hoped that little or no dissatisfaction with the navigation acts will remain.

The examples we have given show the manner in which the mercantilists approached the questions of their time, and it is unnecessary to trace in detail the economic policy which found expression in the corn laws and bounties, in the commercial treaties, and the foundation of colonies. We have said "policy," for the mercantile system was a collection of practical expedients, based indeed on the fundamental principles we have noticed, but never elaborated into a scientific economic system. Such was the state of economic thought when Mun's book was published, and we can now understand the popularity with which it was received. As a scientific work it has no merit whatever. But it appealed to a very strong and growing sentiment, and put into words what most people believed at the time of its publication. Mun's work, with its sequel the *British Merchant*, the name given to the series of papers written in opposition to DE FOE'S *Mercator*, during the controversy on the free-trade clauses of the Treaty of Utrecht (1713), gives the best idea of mercantilism as an economic system. But before the time of its greatest influence forces had been set in operation which ultimately overthrew it, and we must now briefly sketch this movement.

We have already seen the character of the early opposition to the trading companies, and the appeals to natural right as the basis of free trade. The companies won the victory, for in the relation of the government to trade, and the unsettled state of the countries to which the companies traded, their organisation was neces-

sary, and they included amongst their numbers the wealthiest and most influential of the merchants. The outsiders on the other hand were weak and disunited. But with the extension of commerce the number and influence of the latter grew; and it became clear that the exclusive privileges of the companies were an anomaly. The great statute of monopolies (1625) was a step towards freedom of trade; for although many of the evils complained of remained unchecked, it established the principle that none should monopolise for private gain what was the equal right of all English citizens; and it restricted the royal prerogative in the regulation of trade. The agitation against the trading companies was not without important results, for the most powerful of them, the East India Company, was reorganised on a broad national basis (1692-1702). In the 18th century we find little discussion of a subject which had been of such importance in the century before, and Tucker's pamphlet on the Turkey Company (*Reflections on the expediency of opening the trade to Turkey*, 1753) only expressed what was true of all the companies then in existence. It is doubtful whether at this time they were a serious restriction on trade, but they had performed the useful functions they once had, and it was absurd to continue their privileges. In other directions also, *e.g.* in Walpole's colonial policy, and the decay of the Elizabethan system for the regulation of wages and industry, we can see a movement towards free trade.

Meanwhile the theory of natural right was shattering the philosophical basis on which the mercantile system rested. The instances we have given from the history of the trading companies may probably be referred to popular sentiment, or to conceptions derived from English common law. At any rate, the latter was appealed to in the Commons debates of 1601 (Townshend's *Historical Memorials;* D'Ewes's *Journals.*) But the theory grew in influence and the range of subjects to which it was applied; and the levellers claimed universal suffrage and other measures as the natural right of all men (*Clarke Papers*, edited by C. H. Firth for the Camden Society, Introduction). Economic and popular sentiment coalesced with the philosophical movement, and with the development of the theory of the social contract the way was paved for an individualist system of political economy. Philosophical conceptions, however, derived from this source, had little or no influence on economic theory until the time of Hume. Hobbes and Locke took the economic ideas of their age as they found them ready made by the pamphleteers of the 17th century, and merely stated them with greater clearness. During the period with which we have to deal, the economic is of greater importance than the philosophical movement. The attempt to deal with the practical difficulties of the 17th and the 18th centuries supplied those fundamental economic conceptions without which the science could have made no progress.

We have seen that one of the chief sources of error in the works of the mercantilist writers was their confusion of thought on the nature and functions of money. The foundation of the Bank of England (1694) and the recoinage (1696) called forth an immense number of pamphlets dealing directly or indirectly with this subject. It is from this period that we can date the theoretical discussion of economic questions, and the attempt to work out a scientific system. English writers had discussed continental banks many years before the foundation of the Bank of England. We may mention, for example, the *Treatise on Exchange* (1564), to which reference has already been made. In works intended for the guidance of merchants, such as Malynes's *Lex Mercatoria* (1622) and Lewis Roberts' *Merchants Mappe of Commerce* (1638), it was natural that the writers should explain so important a feature of continental practice. The superiority of the Dutch was, as we have seen, partly attributed to their banking system, and during the 17th century the advisability of adopting it in England was frequently urged upon the government (*e.g.* Hugh Morrell to William Lenthall, ii. Jan. 1646-47, *Portland MSS.*, vol. i. p. 405). Generally the establishment of a bank was advocated in pamphlets in which its advantages were discussed. Amongst these we may mention Thomas Violet's *Advancement of Merchandise*, 1651; Sir Ralph Maddison's *Great Britain's Remembrancer*, 1655; Samuel Lambe's *Seasonable Observations*, 1657; W. Potter's *Tradesman's Jewel*, 1659; Francis Cradocke's *Wealth Discovered*, 1661; Sir Edward Ford's *Experimental Proposals*, etc. 1666, etc., which show that for some years before the great experiment people's minds were much occupied with the subject. As these proposals took a more definite shape the number of books published became larger. The banking question was associated with the coinage, the public debt, and general questions of trade and commerce. Sir Dudley North, Sir William Petty, John Locke, Nicholas Barbon, Michael Godfrey, William Lowndes, William Paterson, Robert Murray, John Asgill, Simon Clement, are some among the many names which may be found in English controversy during these years. One pamphlet followed another with such rapidity, and discussion was so general, that it is difficult to single out any one author as the representative of the others. North's *Discourses* (1691), however, should be noticed, and the works of N. Barbon show a deeper insight into economics than those of his contemporaries. Locke's *Considerations of the Lowering of Interest and Raising the Value of Money* (1691), followed by his *Further Con*

siderations (1695), not only refuted the arguments advanced by William Lowndes and others, in favour of his scheme for restoring the coinage, and so saved the country from a great disaster, but contributed much that was of permanent value in economic science. In spite of these merits, however, Locke was strongly under the influence of the mercantile doctrine. The great controversy of 1691 to 1696 finally disposed of the theory of money which underlaid the mercantile system, and the relaxation of its influence was now only a question of time. The persistence of an old theory, long after its refutation, is a common phenomenon in the history of human thought. While the discussion of currency, banking, and credit undermined the theoretical framework of the mercantile system, and the growth of statistics threw doubt upon the balance of trade as a test of economic prosperity, the accumulation of capital and the development of commerce were removing the conditions of which the mercantile system was partly the reflex. During the first fifty years of the 18th century economic progress was slow. Defoe indeed in his *Mercator* had urged a principle which would have led to important results if it had been acted upon. He recommended no less than the *isolation* of economic questions. "Gain is the desire of merchandise: trade is a commutation of merchantable commodities between one country and another, and for the mutual profit of the traders. The language of nations one to another is, *I let thee gain by me, that I may gain by thee* . . . Trading is a matter entirely independent in its nature, and neither consults other interests, nor depends on any interests, but what relate to itself" (*Mercator*, No. 21). But it was the *British Merchant* and not *Mercator* that was sent to every parliamentary borough for the use of the inhabitants.

Why is it, we may ask, that for so great a length of time little progress in economic science has to be recorded? Certainly it was not due to lack of interest in economic subjects. There seems to have been no difficulty in obtaining a hearing. There are literally hundreds of economic writers in England between 1500 and 1752, and every trade crisis or controversy produced its score or so of pamphlets. The reasons for the slow growth of the science seem to have been as follows:—(1) With few exceptions the economic works of this period were written merely to advocate some definite object,—to urge the adoption of some scheme for the improvement of trade, to defend those whose interests were threatened by new developments, *e.g.* the numerous pamphlets on the East India Company, and their relations with the Levant Company, or to protest against some abuse and to suggest a remedy, *e.g.* the pamphlets on the poor laws, the coinage, public credit, etc. This close relation between economic literature and the practical life of the nation was unfavourable to the development of a system of economic doctrine. Mun (*England's Treasure by Foreign Trade*, 1664) expressly states that his work was not intended as an exhaustive and systematic treatise on the economics of the 17th century. He proposed to discuss only "so much of the merchant's practice as concerned the bringing of treasure into the kingdom." (2) Such being the objects of the writers, there is a strong bias in most of them in favour of the organisation or project with which they happened to be identified. The biographies of the earlier writers are therefore of importance, for their personal relations with hostile organisations or individuals, and events in their lives, affected their views to a great extent. (3) When once a controversy was concluded, no one endeavoured to develop and apply the general principles which may have been stated in the course of it. Thus the currency controversy in 1694, and the defence of the East India Company, led to a statement of the main outlines of the principle of the division of labour (SIMON CLEMENT; *Discourse of General Notions*, etc., 1695; *Considerations on the East India Company*, etc.). Other writers such as Petty, Berkeley, Addison, etc., also enunciate this principle. But it lay unregarded until Adam Smith made it one of the fundamental principles of the *Wealth of Nations*. (4) The early writers had to depend, for the most part, on their own knowledge and experience to suggest or illustrate their arguments; trustworthy information on economic subjects was neither so copious nor so widely diffused as it is at the present time. Sir William Petty, John GRAUNT, Gregory KING, and Charles DAVENANT, who laid the foundations of statistical science, all lived in the latter half of the 17th century. So late as 1699 Davenant complains (*Essays on Trade*), that "the aids and lights which might be gathered from the public accompts and offices have been industriously withheld from all who are not servile applauders of the wild and destructive conduct . . . of some persons of no small power in the management of affairs." He and Gregory King are "beginners of an art not yet polished, and which time may bring to more perfection." (5) The early writers employed in their works the language of ordinary business. They had no scientific terminology. Now the language of the market-place is not characterised by scientific precision, and their looseness of phrase gave rise to endless misunderstanding.

The point of view from which early economic literature should be regarded becomes therefore quite clear. It must be studied along with the history of the times at which it was written. This must be carefully borne in mind, or we shall form an erroneous estimate of the value of these early works and the ability of the writers.

We must not expect a uniformity, consistency, and completeness of doctrine and practice which are not to be found. Nothing could be more fatal to the right appreciation of this period than to investigate it with the idea that we shall find in it only illustrations of a well-rounded set of general propositions.

[Much has been written on the history of economics. *Vide* especially Ashley, *Economic History*, vol. i. pts. i. and ii.—Cunningham, *English Industry and Commerce*.—Endemann, *Die Nationalökonomischen Grundsätze der Canonistischen Lehre*.—Hewins, *English Trade and Finance*.—Heyking, *Handelsbilanztheorie*.—Knies, *Politische Œkonomie*.—Roscher, *Geschichte der Nationalökonomik in Deutschland*.—*Political Economy* (trans. Lalor), *Geschichte der englischen Volkswirtschaftslehre*.—Schanz, *Englische Handelspolitik*.] W. A. S. H.

ENGLISH SCHOOL OF POLITICAL ECONOMY.

Before Adam Smith, p. 730; Modern Economics, p. 733.

BEFORE ADAM SMITH.—The English writers on political economy before Adam Smith do not at any time present the marks of a "school," properly so called. The nearest approach to a "school," so far as community of doctrine is concerned, is found among the mercantilists; but even these writers owe no allegiance to any personal authority. Their views are individual and independent; and it is only with Adam Smith that the English school *par excellence* begins. The rise of that school was affected by many influences, English and foreign. Of these the genesis of economic theory in England must be sought chiefly through the writings of the authors whose names are mentioned in the rapidly-connected sketch which follows.

There is much that is of interest not only to the economic historian but also to the student of economic theory in the early statutes and the records of the social history of England, but few English writers earlier than the 17th century call for special mention in this article. Langland, in his *Visions of Piers the Plowman* (14th century), and the writer of the *Libell of Englishe Policye* (15th century) incidentally supply some interesting illustrations of the course of life in England during those periods. The writings of WALTER OF HENLEY (13th century), FITZHERBERT (16th century), and TUSSER'S *Five hundreth pointes of good husbandrie* (Tottel's edition, 1573), throw light on the state of agriculture and the condition of the people. "W.S." (see HALES, JOHN) in his *Discourse of the Common Weal of this Realm of England* (written 1549, printed 1581), acutely discusses the contemporary depression of agriculture and industry. His attempts to show that the "alteration of the coyne is the cheifest and principall cause of this universall dearthe" are highly interesting examples of early economic argument and analysis. More's *Utopia*, 1518, imbued as it is with the ideas of classical antiquity, has more affinity with the *Republic* of Plato than with the industrial utopias of later writers. The chief impetus to the publication of *Discourses upon Trade*, was afforded by the problems of policy in colonial trade by which the commercial activity of the English people, following upon the enterprise of navigators and adventurers, found itself confronted. This is noticeable as early as the essays of BACON, 1597 ("Of Plantations"), and the writings of RALEIGH. From the incorporation of the East India Company, 1600, there is a continuous succession of writers on the theory of foreign trade which formed the kernel of the old MERCANTILE SYSTEM. The mercantile school may indeed be said to continue its existence in quite different forms from this time to the days of STEUART. The traffic in the precious metals naturally attracted the attention of statesmen and of merchants alike; and from the reign of Edward III. onward, attempts were made to regulate its exchange for imported commodities. The inevitable export of bullion for the East India trade found an ingenious apologist in MUN, who, in his *Discourse of Trade from England into the East Indies*, 1621, and *England's Treasure by Forraign Trade*, published 1664, shifted the ground of the BALANCE OF TRADE from the position which it holds in the writings of ARMSTRONG (1530) and MALYNES (1601). He argued that this export, like the seed cast away by the husbandman, was in the long run amply repaid in kind, and that the raw material which the precious metals purchased, when worked up and sold to foreign countries, caused the national stock of bullion to be increased and not diminished. "The title of Mun's book, *England's Treasure in Foreign Trade*, became a fundamental maxim in the political economy, not of England only, but of all other commercial countries" (*Wealth of Nations*, bk. iv. ch. i.). Malynes, *The Canker of England's Commonwealth*, 1601, and *Lex Mercatoria*, 1622, describes the Ancient Law Merchant as well as the contemporary habits and institutions of trade; and LEWES ROBERTS, *Merchants Mappe of Commerce*, 1638, *Treasure of Trafficke*, 1641, explains the operations of commerce, and recommends practical measures,—*e.g.* free export of gold and silver, and low customs,—for its promotion. His *Mappe of Commerce* is a mercantile geography, showing the situation, exchanges, and commodities of trade of different places. MISSELDEN (*Free Trade*, 1622, *Circle of Commerce*, 1623) exhibits the Spaniards as warnings, the Dutch as models in mercantile policy, and disputes with Malynes the causes and consequences of an unfavourable balance of trade. The example of the low rate of interest in Holland further stimulated the CULPEPERS, father and son, to urge the reduction by parliament of the legal rate of interest—a demand supported with much weight by

CHILD (1668), whose business instincts, superior to his scientific theory, were probably not at fault when he supposed such a measure would redound to the encouragement of English commerce. The unsoundness of some of the arguments which he employs was pointed out in *The Interest of Money Mistaken*, 1668.

Passing by the utopia of HARRINGTON (*Oceana*, 1658), and such agricultural writings as those of Blith, *The English Improver Improved*, 1652, HARTLIB, *Legacy of Husbandry*, 1655, WORLIDGE, *Systema Agriculturae*, 1668, and John SMITH, *England's Improvement Revived*, 1670, we come to the speculations of HOBBES, 1670, and ASGILL, 1696, on the nature and causes of wealth. Particular recommendations for the improvement of trade by the naturalisation of aliens, and in favour of the policy of enclosures, are found in FORTREY, *England's Interest and Improvement*, 1663, and COKE, 1671. Fortrey's statement that the country "lost" £1,600,000 a year by its trade with France, long had a discouraging effect. The despondent tone of most writers of this time is echoed in the title of *Britannia Languens*, 1680, and in the arguments of its pseudonymous author (Philanglus), that the importation of foreign luxuries was a "consumptive trade" which threatened to bring about the decay of the nation while money was exported for them. The same writer urges the "legal regulation" of trade, to prevent its destruction by "private interest" and by the "cloggs" of navigation acts, companies, monopolies, etc. Similar views with regard to the eastern trade are found in POLLEXFEN'S *England and East India Inconsistent in their Manufactures*, 1697—a reply to DAVENANT'S *Essay on the East Indian Trade*, 1696-97. A more hopeful note is struck in *England's Great Happiness: wherein it is demonstrated that a great part of our Complaints are Causeless*, 1677, and in the optimistic preface of PETTY'S *Political Arithmetic*, 1682, which opposed to vain imaginings and timid surmises the positive conclusions of comparative statistics, and drily observed that the price of food was "so reasonable, as that men refuse to have it cheaper, by admitting of *Irish* cattle." The best thought of the time had now for many years been directed into the channels of trade, and produced, as was natural, an abundant crop of pamphlet literature on all questions connected with "the Science of the Great Commerce." Comparative study of other nations, especially of France, Holland, and Spain, was one main source of the inspiration of these writings, and numerous proposals sprung up for establishing banks (see ASGILL, BRISCOE, CARY, CHAMBERLAIN, CRADOCKE, LEWIS, MURRAY, PATERSON) and for emulating Holland in other matters. This spirit is shown in YARRANTON'S *England's Improvement by Sea and Land: To outdo the Dutch without fighting*, etc. (pt. i. 1677; pt. ii. 1681), in Sir Wm. TEMPLE'S *Observations on the Netherlands*, 1693, and in the popularity of the translations of "John de WITT'S" *True Interest and Political Maxims of Holland*, 1702, etc. (see DUTCH SCHOOL).

An important epoch is marked by GRAUNT'S *Natural and Political Observations upon the Bills of Mortality*, 1662, with which begins the science of DEMOGRAPHY, as statistics, and the theory of taxation may be said to commence with Graunt's more famous friend Sir Wm. Petty, whose remarkable treatises on *Taxes and Contributions*, 1662, *Political Arithmetic*, 1682, and the *Political Anatomy of Ireland*, 1691, exhibit an ingenuity of method and grasp of principle rarely if ever shown by his predecessors. The first table of mortality was published by HALLEY in 1693. DAVENANT (1699) and GREGORY KING (in 1696) continued the work of statistics (see ARITHMETIC, POLITICAL); while the current views on the balance of trade found an able opponent in BARBON (1690), who was soon to cross swords with LOCKE on the subject of money.

The proposals of LOWNDES, then secretary to the treasury (1695), to coin the new (silver) money lighter, provoked the opposition of Locke, whose able writings on money at this critical period of the great recoinage (see RECOINAGES) are still appealed to in controversies of to-day upon the history of the currency. The earlier work of VAUGHAN, *Discourse of Coin and Coinage*, 1675, should also be mentioned here. Mingled with the discussions of semi-political questions by earlier authors are many glimpses of a broader consistent theory, general principles of which now begin more clearly to emerge. The close of the 17th century is indeed a time conspicuous for the ability of English economic writers. Barbon's *Discourse of Trade*, 1690, contains some striking analyses of value, price, interest, and rent. NORTH'S *Discourse of Trade*, 1691, is an admirable exposition of the merits of free exchange. FLEETWOOD'S *Sermons against Clipping and Sweating of the Precious Metals*, 1694, precede by thirteen years his *Chronicon Preciosum* or history of prices, familiar to students of Adam Smith. The problem of the conditions of the poor which had fitfully occupied statesmen since the date of Richard II., in whose reign the earliest legislation for dealing with impotent beggars took place, seriously engaged the attention of FIRMIN (1678), HALE (1683), Child (who proposed the appointment of poor-law guardians or "fathers of the poor"), Cary (1695) and BELLERS, *Proposals for Raising a Colledge of Industry of all Useful Trades*, etc. 1695-1696. From DEFOE'S lively and prolific pen came, in 1704, the vigorous essay, *Giving Alms no Charity and Employing the Poor a Grievance to the Nation*, in which it was contended that workhouse labour should not be employed in competition with outside industry. The same writer's *Compleat English Tradesman*, 1725-27,

and *Plan of the English Commerce*, 1728, are the chief of his other numerous works on subjects relating to trade. John HOUGHTON, F.R.S., *Collection for the Improvement of Husbandry and Trade*, 1692-1703 (particulars of prices of corn, cattle, coal, hops, wool, etc.); *The British Merchant; or Commerce Preserved*, 1713 (papers collected and published by Charles KING, 1721); and Defoe's *Mercator, or Commerce Revived*, 1713, 1714 (an opposition paper to *The British Merchant*), afford useful details for the history of commerce.

LAW'S *Money and Trade considered*, 1705, exhibits at once the power and the defects of his erratic genius; original, daring, and acute, he admits no limit to the bounds of credit, and has little thought of its contraction. His book marks, however, a real advance in the study of money and credit. WOOD'S *Survey of Trade*, 1718, also deals with money and bullion. MADOX is an invaluable source of information for the economic historian in his *Antiquities of the Exchequer*, 1711, and *Firma Burgi*, 1726. In Ireland appeared about the same time the well-known *Drapier's Letters*, 1725, in which SWIFT inflamed the anger of his countrymen against Wood's copper halfpence; DOBBS' essay on "The Trade and Improvement of Ireland," 1729-31; and BERKELEY'S *Querist*, 1735, a collection of searching and suggestive inquiries in economics, revealing at once the author's mind and the degree of development which the science had then attained. Swift's *Modest Proposal for preventing the Children of Poor People from being a burden to their Parents or the Country*, 1730, is an elaborate joke framed in a tone of ironical and pseudo-economic savagery. GEE'S *Trade and Navigation of Great Britain considered*, 1729, is a despondent treatise of mercantilism, affecting to show "that the surest way for a nation to increase in riches is to prevent the importation of such foreign commodities as may be raised at home." VANDERLINT'S *Money Answers all Things*, 1734, on the other hand ably argues for free trade, while MANDEVILLE'S *Fable of the Bees, or Private Vices, Publick Benefits*, 1706, 1714, 1723, etc., urges the social advantages of individual liberty. Both books mark a movement in the direction of LAISSEZ-FAIRE. DECKER'S *Proposals*, 1743, for raising the whole revenue by a single tax on houses, and the *Essay on the Causes of the Decline of the Foreign Trade*, 1744, show much ingenuity in the study of taxation. John SMITH'S *Chronicon Rusticum Commerciale*, or *Memoirs on Wool*, 1747, is an industrious compilation of standard value upon this great branch in the history of English trade. Equally laborious but less praiseworthy are the *Dictionaries of Trade and Commerce* of POSTLETHWAYT (1751), ROLT (1761), and MORTIMER (1766). Postlethwayt's, the best of the three, was founded mainly upon the French dictionary of SAVARY. In 1751 and 1753 appeared translations from the Spanish of USTARITZ and ULLOA of the history of trade in Spain, and in 1753 a translation from the German of MAGENS' *Universal Merchant* (postscript 1756). The last two writers are mentioned by Adam Smith. FRANKLIN'S *Observations concerning the Increase of Mankind*, 1751; HUME'S essay of "The Populousness of Ancient Nations" in his *Political Essays*, 1752; and WALLACE'S *Dissertation on the Numbers of Mankind in Ancient and Modern Times*, 1753, show an interest in the progress of population, its causes and limits, nearly half a century before MALTHUS. The middle of the 18th century recalls the end of the 17th by the fertile ability of its economic writers. Hume's *Essays* contributed powerfully to the development of sounder views on money and the balance of trade. Wallace, in his *Characteristics*, 1758, discusses the functions of paper money and credit. The essays of Patrick Lord ELIBANK, on *The Public Debt* were published in the same year (1753) as FIELDING'S *Proposal for making an Effectual Provision for the Poor*. The most important writings appearing at this time were, however, those of CANTILLON, MASSIE, and TUCKER.

Cantillon's posthumous *Essai* (published 1755) is the earliest approach to a complete presentation of economic principles, tracing the distribution of wealth by the guiding thread of a central theory of value. Its influence was greatly felt in the FRENCH SCHOOL, but is also clearly seen in the *Essay on Money and Coins* of HARRIS (1755-58). Massie (see *infra*), though best known by his criticisms of Decker's and FAUQUIER'S proposals in taxation and by his *Essay on the Governing Causes of the Natural Rate of Interest* (1750), has been shown by Dr. Cunningham to have left a bibliography of economic literature of the highest value (*Economic Journal*, vol. i. No. 1). Tucker (see *infra*), dean of Gloucester, is remarkable for the breadth and liberality of view with which he regards the economic aspect of colonial and foreign politics. Tucker accepted with pride the sarcasm of Warburton, that he made a religion of trade as other ecclesiastics had been known to make a trade of religion. The dignity of economic study did not much longer need vindication. His *Reflections on the Expediency of a Law for the Naturalisation of Foreign Protestants*, 1751, were translated into French by Turgot (1755). His *Brief Essay on the Advantages and Disadvantages which respectively attend France and Great Britain with regard to Trade*, 1750, is said by BLANQUI to show the influence upon Tucker of the French economists with whom he was in close correspondence. But there can be little doubt that in their relations with Tucker at this time they were rather disciples than masters.

The high esteem in which the early English writings was held abroad was no doubt largely

due to the superiority of English commerce which gave them birth. It was felt with justice that a nation of successful merchants were worth listening to on matters of trade. The French in particular richly repaid their debt to us through Adam SMITH, upon whose mind they impressed their systematic and logical views; but it should not be forgotten that those views were largely founded on the practical judgments of English writers. Nor can the diligent student of the *Wealth of Nations* fail to be struck by the extent to which that work is rooted upon the earlier English writings. And though in the crucible of Adam Smith's mind the materials of his predecessors are often refined, they still do not defy recognition, but testify to the close continuity of the English school.

It has not been possible in this slight account to do more than enumerate some of the writers who preceded Adam Smith. For fuller notices the student is referred to the separate articles under the names of the authors. Contemporaries of Adam Smith are dealt with in a later portion of this article. It is only necessary to mention as appearing before 1776, the *Three Tracts on the Corn Trade and Corn Laws*, 1758, by Charles SMITH, whom Adam Smith has described as "ingenious and well-informed"; the important *Inquiry into the Principles of Political Economy* of STEUART, 1767 (see *infra*); ANDERSON'S *History of Commerce*, 1764; FERGUSON'S *History of Civil Society*, 1767; PRICE on *Reversionary Payments*, 1769, and on the *National Debt*, 1774; and Arthur YOUNG'S *Farmer's Letters*, 1771, *Rural Economy*, 1773, and *Political Arithmetic*, 1774, with some of his earlier *Tours* in the English counties. H. H.

MODERN ECONOMICS. PERIOD I. ADAM SMITH.—After the Union of 1707, Scotland began to play a part in English economic study. Francis HUTCHESON (professor of moral philosophy at Glasgow, died 1747) turned the attention of Scottish philosophers to economic questions, on which he himself touches, though briefly, in his published works (*e.g.* in his *Inquiry into the Original of our Ideas of Beauty and Virtue*, etc., 1st ed. 1725). The notion of the "greatest happiness of the greatest number" appears in Hutcheson, and he also lays stress on the connection between industry and self-interest, industry and property, thus carrying on the discussion raised by Mandeville (*Fable of the Bees*, etc., 1706, and later eds.), on the nature of the motives to economic action. The activity of the Scotch press (Foulis, Urie, etc.) in the publication and reprinting of economic treatises becomes noticeable about this time (say 1750 to 1770). Adam FERGUSON in the 4th ed. of his *History of Civil Society* (1773), announced the forthcoming work of Adam Smith, which was to be "a complete theory of national œconomy"; but Ferguson's own economical views (*e.g.* on division of labour) are given incidentally along with his political philosophy, and not in a separate treatise. In his *Institutes of Moral Philosophy* (1769), where he treats of economical questions, he borrows to some extent from Joseph HARRIS (*Essay on Money and Coins*, 1757). To much greater effect David HUME, who had learned from Hutcheson, had prepared the way for his friend Adam Smith by his keen criticism of the current views of the balance of trade, to say nothing of his pregnant remarks on the other subjects embraced by the "Mercantile Theory" (*Essays on Commerce, Money, Interest*, etc., 1752). Economical subjects receive separate consideration, and Hume's reasonings upon currency, credit, and population were of special influence. In the controversy as to the populousness of ancient nations he took the side of the moderns. In the matter of public credit, or national debts, he took the view that national debt would eventually prove the ruin of modern nations. He points out that the quantity of metallic money in a country does not determine the rate of interest, also that a time of increasing currency is a time of lively trade. He thinks that commercial jealousy rests on a false idea that one party must always be the loser, in a bargain. He goes, if not as far as Adam Smith, nearly as far as Josiah Tucker (*Advantages and Disadvantages which respectively attend France and Great Britain with regard to Trade*, 1750). But it was left to Sir James Steuart and Adam Smith to recognise for their own country what had already been made good by the physiocrats in France (see PHYSIOCRATS and FRENCH SCHOOL), that economical subjects must be a study by themselves. Sir James Steuart's book (*An Inquiry into the Principles of Political Economy, being an Essay on the Science of Domestic Policy in Free Nations*), written in exile in Germany, and first published (in Edinburgh) in 1767, made no impression on the public to be compared with that of Adam Smith's *Inquiry into the Nature and Causes of the Wealth of Nations* (1776); and was rather a revised edition of the mercantile theory than a new departure. The immediate popularity of Adam Smith's work, on the other hand, was largely due to its crushing criticisms (especially in bk. iv.) of the "commercial system," which was tracked out and destroyed in all its logical ramifications, however tenaciously it might afterwards survive in political practice. The idea of "natural liberty" organising industry, and transforming society "of its own accord," was stated by Adam Smith even more boldly than by the French economists, and he avoided their mistake of restricting productiveness to agriculture (bks. iv. ix.) In his chapters "On the Revenue of the Sovereign or Commonwealth" (bk. v.), he came out as "the greatest of theorists on finance" (Bastable); and no economical treatise ever exerted greater political influence.

On economic theory its influence has been also very great, though it was not so immediately visible, and is now partly spent. The definition of wealth, the discussions on labour, wages, rent, interest, and the short remarks on value, served as starting-points for more thorough and satisfactory consideration of these matters. Adam Smith's method of reasoning, though frequently deductive, involves so full an illustration from facts and statistics, where such were accessible, that he has often been claimed as an inductive economist. The industrial changes then taking place in England gave his treatise a peculiar historical importance, if they were not indeed responsible for its creation. Similarly, if we pass by Bentham's correction of one false concession in "the Wealth of Nations" (see BENTHAM), the next contribution to English political economy was largely occasioned by a change in the condition of the people.

PERIOD II. MALTHUS AND RICARDO.—The poor law of W. PITT, proposing a bounty on large families, and the popularity of Godwin's political theories, led MALTHUS to bring forward in his *Essay on Population*, 1798, a clear-cut theory of "the principle of population." He inquired into the nature and causes of poverty, as Adam Smith into those of wealth. The tendency of population to increase up to the limits of the means of subsistence was brought out more strongly than the checks on this tendency, which were not adequately stated till the book had emerged from the floods of criticism into a second edition (1803). The views of Malthus on general economic theory were not elaborated with such perfect lucidity as his doctrine of population; he tended either to fall back on physiocratic views, or to theorise, as on the measure of value and the corn laws, with a subtlety inconsistent with clearness. He maintained views on overproduction which brought on him the damaging criticisms of J. B. SAY. On the other hand, he shares with JAMES ANDERSON, and Sir E. WEST, the credit of first stating what is usually called the Ricardian theory of agricultural rent, that rent is the effect not the cause of price, and that it depends on the graduated fertility of lands. RICARDO, who first obtained fame by his *Letters on the High Price of Gold Bullion* (1809), and made an enduring mark on the theory of currency, owes his prominence in economic literature to his *Principles of Political Economy and Taxation* (1817). In this book he pushed the theory of rent farther than its discoverers, and made it, together with a new theory of value, the centre of a theory of the distribution of wealth between the three parties concerned in its production—the labourers, the employers, and the landlords. The value of manufactured articles is determined mainly by the quantity of labour necessary to the production of them, and of agricultural products by the quantity of labour necessary to the cultivation of the worst land actually cultivated. The height of this "margin," to use the phrase of Dr. CHALMERS, determines the amount of profits to the employers, and the amount of rent to the owners of all land above the worst. Ricardo's qualifications of this theory were neither numerous enough nor clearly enough stated; and, even if the theory had not been reproduced, as by M'CULLOCH, without the qualifications, a reaction against Ricardian political economy could be only a matter of time. But it held the field for nearly a generation after the publication of the *Principles*. It found popularisers both humble and eminent (Mrs. MARCET and DE QUINCEY): James MILL followed it wholly, and SENIOR with reservations that seemed in those days unimportant, though in after times the acuteness of Senior has been better recognised. TORRENS did not succeed in establishing his claims to independent authority, nor did Chalmers restore the authority of Malthus. WHATELY, LONGFIELD, LAWSON wrote clearly but without making any decidedly new departure. Professor Richard JONES, in appealing against Ricardo to the history of India, was before his time. The minor writers (see below) left fruitful hints, but made few converts among students of the subject. Robert OWEN and his followers gained little hearing in the world of letters. The victory of FREE TRADE (1846), the passing of the early FACTORY ACTS, the rise of CHARTISM, and the regulation of the paper currency (see BANKING), affected the course of economic discussions; and the French Revolution of 1848 played a part in England as well as on the Continent French and German writers began to acquire greater influence than ever before.

PERIOD III. JOHN STUART MILL.—Their influence was shown in John Stuart Mill's *Political Economy* (1848). This book was an attempt to combine abstract economical theory with the modifications necessary for its application in the concrete, and to view the whole of economics in relation to other parts of the philosophy of society. As Mill went beyond Bentham in his ethics, he went beyond Ricardo in his economics. Long before this time Mill had, like SENIOR, given attention to the question of method, which was afterwards to become an object of lively discussion.

The study of COMTE and other foreign writers had led Mill to doubt whether abstract theory was allowable at all in social inquiry. He retained it, however, for political economy; and in his chief economic book the abstract theory is presented, along with the modifications, being little more than a careful re-statement of Ricardian principles. He had wished to do for his own day what Adam Smith had done for his (see preface to Mill's *Political Economy*); and the influence of his book was so great that it seemed as if a new departure had

been taken and a new era begun. But Mill was so far from overthrowing the old doctrines that he really strengthened their hold at a time when it had been loosened. Yet, by his emphasis on the relativity of abstract economics to particular societies, and on the possibility of far-reaching changes in the social system, he showed an affinity with "historical economists," and "scientific socialists." The former found their earliest representatives in Cliffe LESLIE and Thorold ROGERS; and their views are now energetically advocated by INGRAM, CUNNINGHAM, and Ashley. The CHRISTIAN SOCIALISM (of MAURICE, KINGSLEY, LUDLOW, NEALE, Hughes) grew out of Owen and Chartism; and its upholders, in advocating co-operative production, appealed rather to philanthropy and human brotherhood than to cool economic theory. The scientific socialism of MARX, avowedly based on the Ricardian theory of value, can hardly be said to have representatives in this country among professed economists. In his views of Land Reform, Mill (like his father), approached very near to socialism; but his attitude to socialism as a general policy is quite as truly critical as sympathetic.

PERIOD IV. W. S. JEVONS.—This cool reception of scientific socialism is mainly due to the rejection, by Jevons and his closest followers, or the serious modification, by Marshall and Sidgwick, of the Ricardian theory of value. The ideas of Jevons have had greater power since his death than during his life. He was too impatient at the almost universal submission to Mill's authority to do Mill complete justice. But he was one of the first critics of Mill who attracted general attention at all; and, since his time, there has been less submission to authority of any kind. There has no doubt been a line of writers who follow the older school very straitly (FAWCETT, CAIRNES, MALLET) as among statesmen there has been a line of supporters of the old economic policy identified with BRIGHT and COBDEN. But changed conditions have forced most leading statesmen to go beyond *laissez-faire;* and new aspects of old problems have led theoretical economists into deeper study of particular questions (*e.g.* CONSUMPTION) than before. The mathematical treatment of economical data has practically fallen into the hands of a wing of the school of final utility, which is often spoken of as a school by itself, the mathematical school (Edgeworth, Wicksteed). Amongst the many writers who have taken part in discussions on currency and banking, Mr. H. D. Macleod has fallen back on WHATELY'S view that economics is simply catallactics, Bonamy PRICE has professed to represent unaided common sense, BAGEHOT has insisted on the need of formulating deductive economics for "advanced" nations, and on the impossibility of doing so for uncivilised peoples. Bagehot's lucid writings on banking and depreciation helped to keep these questions before the minds of economists; and the fall of silver since 1870 has made bimetallism versus monometallism an object of lively debate. The dominant view among professed economists after Jevons seems to be that bimetallism under certain conditions is possible, but that the conditions are difficult of fulfilment. The question has been discussed in close connection with the subject of the metallic reserves of our English banks, and, in this as well as other connections, the wisdom of the Bank Charter Act of 1844 is not now upheld by the majority of economists. A large part of the recent work of economists in England has been the restatement of the older doctrines, with the fresh light afforded by the theory of value laid down in 1871 by Jevons in this country, and substantially one with the theory of the AUSTRIAN SCHOOL OF ECONOMISTS. In connection with this, there has been practically a new theory of wages and profits, towards which not only Jevons but Walker has contributed very essentially. The idea of a wages fund, as held by Ricardo's immediate successors, and till 1869 by J. S. Mill, has been abandoned as Longe and W. T. THORNTON had foretold. The distinction of interest from profits—capitalist from employer, has been better kept in view—largely owing to the writings of Walker The application to wages, interest, profits, and even taxation, of the idea of final utility has been pursued vigorously. Probably at no time have questions of economic theory ever been more ardently discussed in England than at present; and these discussions have hope of greater fruitfulness than before, because conducted now (*a*) with a much more adequate knowledge of what is written and said, about the subjects concerned, on the Continent of Europe, and in the United States of America, and (*b*) with a closer regard to the facts of everyday life, as the touchstone of all theories. Economists are more conscious than at any previous time of the importance of statistics for the understanding of the phenomena of society. They are also more keenly aware, partly from the influence of CARLYLE and RUSKIN, of their need of contact and sympathy with men and associations of men in the surrounding world, though they keep in mind the distinction of an economic theory from a mere record of facts or a mere utterance of philanthropic aspiration.

Even in this short sketch it would be wrong to omit mention of the minor writers and amateur economists. Every great industrial or financial change, besides awaking a corresponding movement of speculation among professed economists, has been reflected in the fugitive literature of the day; and there has often been a subordinate movement of social, political, and economic theory, apparently quite aside from the path of the classical economists. The

writings of the agriculturist, Arthur YOUNG, and the financier and politician, Richard PRICE, had a certain influence on economical study. In the dark days of the French War the writings of William GODWIN may be said to have given the first impulse to the socialistic speculations afterwards carried out by Charles HALL, Robert OWEN, EDMONDS, GRAY, J. F. BRAY, and William THOMPSON. With Thomas SPENCE begins the movement for the nationalising of the land, countenanced in theory at least by James Mill, and advocated in later times by DOVE, George, and A. R. Wallace. The books of PAINE include not only deistic and political utterances, but useful admonitions in regard to paper currency in the early days of the suspension of cash payments. Ld. LIVERPOOL'S *Coins of the Realm* (1805), with the mass of pamphlets (see *e.g.* H. THORNTON, Lord KING, Boyd, BARING, BOSANQUET, HUSKISSON, TROTTER) called forth by suspension and by the Bullion report, form a considerable literature, in the face of which (and often by the aid of it) the theories of economists like Ricardo shaped themselves. Such books as Thomas TOOKE'S *History of Prices*, ably continued by NEWMARCH, and in a less degree COLQUHOUN'S book on the *Resources of the British Empire*, and (later) PORTER'S on the *Progress of the Nation*, helped to point economists to the more ample use of statistics; and this service is now rendered by writers like Guy, Rawson, PALGRAVE, BOOTH, GIFFEN, and others in the journal of the "Royal Statistical Society" (founded 1834).

The "refutations" of Malthus on population proceeded from all sorts and conditions of men. Many men of the stamp of COBBETT and Perronet THOMPSON took up every economic controversy that had a conspicuous political side. The new Corn Law of 1815 gave birth to a multitude of pamphlets and books on the corn laws, and eventually, after HUSKISSON'S reforms, to the movement that took shape in the ANTI-CORN LAW LEAGUE, and was kept up vigorously by the MANCHESTER SCHOOL of Free Traders. Concurrently with this movement and later in its political victory came the agitation for extension of the FACTORY ACTS, with a literature of its own. The discussions in regard to emigration (see SELKIRK) and (later) colonisation (see TORRENS, WAKEFIELD, and HILL-BURTON) as well as in regard to the reform of the poor law, produced not only small tracts but large volumes in which economists still find useful materials. The value of English blue books on such topics can hardly be over-estimated, and since the establishment of a labour department (1893) their usefulness in this particular field may be expected to increase. Where economic policy has touched closely the business of the City, as in the Bank Charter Act, the repeal of protective duties, and the repeal of the navigation act, commercial men have taken the lead in the composition of pamphlets contending for or against particular measures by the aid, as a rule, of a popular political economy. Yet on such matters as banking and the foreign exchanges such pamphlets have not unfrequently achieved a permanent place in classical economic literature.

The great development in the last seventy years of organisation among the working classes has led to considerable modifications of economic theory (see WAGES FUND). This organisation has shown itself most notably: (1) in trade unions and other benefit societies among skilled labourers; (2) in co-operative societies for sale of goods. The former are federated somewhat loosely in the trade union congress, the latter very compactly in the co-operative union. Hitherto co-operative production in the sense of partnerships of workmen has not advanced rapidly. The latest phases of the organisation of the working classes are: (1) the growth of trades societies among women, and especially (2) the "new unionism," which has two chief features (*a*) the organisation of unskilled labourers, (*b*) the policy of united action by all the organised groups when the interest of perhaps only one is at stake. These movements have undoubtedly influenced politics in the direction of greater interference by the state than was contemplated by our forefathers.

Indications that political economy has not lost its attractiveness for the English mind may be seen in the foundation of the British Economic Association (1890), its organ the *Econ. Journal* (1891), and indeed in the present *Dictionary*. The *Econ. Review* (1891) covers partly the same ground, though not so strictly economic as the *Econ. Journal*. The Cobden Club is still on the watch against protection and over-interference of the state. The Statistical Society has a journal coeval with the society, embodying its transactions, with much other valuable matter. The *Economist*, under the editorship of such men as Wilson, Bagehot, and Palgrave, has done valuable service in presenting clear, vigorous, and solid economic argument on questions of the day. With the *Statist* it represents on the whole the views of the economists of the City. The *Banker's Magazine* does the same for the world of bankers. Many papers of a strictly economical character (especially those of Jevons and Giffen) have been published in journals like the *Contemporary Review*, not addressed to professional economists but to the educated public generally. It is to be regretted that fugitive economic literature, whether in pamphlets or articles, has not yet found its historian; J. R. M'Culloch attempted the work in his *Literature of Political Economy* (1845), with a fair measure of success.

The series of volumes edited by M'Culloch (printed for the Political Economy Club and Lord Overstone), in some degree supplement his work, at least for the early part of the period above treated; their titles are: *A Select Collection of Scarce and Valuable Tracts on Money*, London, printed for the Political Economy Club, 1856.—*A Select Collection of Early English Tracts on Commerce*, London, printed for the Political Economy Club. 1856.—*A Select Collection of Scarce and Valuable*

Tracts and other Publications on Paper Currency and Banking, printed by Lord Overstone, London, 1857.—*A Select Collection of Scarce and Valuable Tracts and other Publications on the National Debt and the Sinking Fund*, printed by Lord Overstone, London, 1857.—*A Select Collection of Scarce and Valuable Tracts on Commerce*, printed by Lord Overstone, London, 1859.—*A Select Collection of Scarce and Valuable Economical Tracts*, printed by Lord Overstone, London, 1859.—*The Evidence given by Lord Overstone before the Select Committee of the House of Commons of 1857 on Bank Acts*, London, Longman, Brown and Co. 1857.—*Tracts and other Publications on Metallic and Paper Currency, by the Right Hon. Lord Overstone*, London, Longman, Brown and Co., 1858.

ENGROSSING. See FORESTALLERS and REGRATORS.

ENREGISTREMENT, Fr. One of the principal divisions of the French finances, consisting of a registration duty on all deeds and documents, including notarial acts, judgments, contracts, sales, leases, indentures, wills, insurance policies, loans, articles of association, successions, transfers of property, etc. The registration dues have been frequently criticised for their exaggeration. M. Leroy Beaulieu describes them in his *Traité de la Science des Finances*, as a fiscal brigandage. He admits the utility of registration as a record of transactions in case of loss of the original deeds, but adds that the tax is only justifiable provided that it is of moderate amount, whereas as it is established in France it frequently becomes a confiscation of private fortunes by the state. The effect of this heavy charge is to restrict the free circulation of such property. T. L.

[*Code annoté de l'enregistrement et du timbre*, par Dalloz et Vergé, Paris, 1878.—*Annuaire de l'administration de l'enregistrement*, P. Dupont.]

ENSENADA, ZENON DE SOMODEVILLA Y BENGOECHEA, Marquis de la (1702-1782), died in Medina del Campo. Belonging to a noble but poor family, through his personal merit, he rapidly rose to the highest rank, made an immense fortune, and received the title of marquis in 1736 from the Infante Don Carlos, afterwards Charles III. of Spain.

Ensenada was one of the most efficient finance ministers of Spain. Under his administration, the ordinary revenue rose in a few years from 211 to 360 millions of *reales* (say from 21 to 36 millions sterling), although he contrived to alleviate the pressure of the enormous and vexatious taxation which oppressed the lower classes of the population. He put an end to the scandalous exactions of the farmers of the *rentas reales* (royal taxes). He established *registros* or register ships, which were allowed to trade with America independently of the *flota* and galleons. The flota was the annual fleet between Spain and her American colonies, the galleons were the

trading vessels escorted by the fleet. He formed the design of doing away with the *millones* or numerous minor excise taxes and tolls which weighed on every transaction of daily life, and of compensating the resulting deficiency by a better management of the customs and of the excise on salt and tobacco, and by establishing in Castile the *unica contribucion* or single tax, which was to be of 4 per cent on every species of income and property. It had been suggested for more than a century by the majority of Spanish economic writers and introduced into Catalonia in 1729. The preliminary survey or *catastro* was begun under his direction. Ensenada also abolished the internal duties, which interfered with the transport of corn from one province to another, and improved the means of internal communication. The royal navy, military ports, and arsenals were the object of his incessant and successful exertions, which were extended to almost every branch of government.

Ensenada's views and plans are explained in clear and straightforward language in the *Representaciones*, which he submitted to King Ferdinand VI., and which have been given in full for the first time in Don Antonio Villa's excellent biographical essay (*El Marques de Ensenada*, Madrid, 1878). One of them, written in 1751, will be found, although not quite complete, in the *Semanario Erudito* of Valladares (Madrid, 1788, vol. xii. p. 260), and in French in the French translation of Coxe's *Memoirs of Spain under the Bourbon Kings*, published by Andres Muriel in Paris in 1827 (*L'Espagne sous les rois de la Maison de Bourbon*, vol. iv. p. 282). Coxe gives a very favourable account of the internal administration of Ensenada (ch. liv.); which will be discussed in a special notice by Count Fernan Nuñez in his *Vida de Carlos III.*, now (1892) in the press. E. Ca.

ENTAIL, Law of. An entail is defined by Wharton (*Law Lexicon*) as "an estate settled with regard to the rule of its descent." The object of legislators in recognising entails has been to preserve estates undiminished in the hands of successive generations of the same family. This fixity of landed property was essential to feudalism, which based the political rights and duties as well as the social consideration of each individual on his relation to the land. Feudal law, therefore, regulated the disposition and devolution of land less with reference to the wishes of the owner or to the increase of the riches of the community, than with reference to the permanence and efficiency of the feudal organisation. Feelings of family pride deepened by feudal ideas contributed in turn to perpetuate the system of entails which had fostered them. But in the main the system of entails is a political institution.

In one form or another the system of entails may be traced in every country where feudalism established itself. In many of those countries it disappeared in the series of political changes which opened with the French Revolution. In England, however, it has survived, but with many modifications which have almost destroyed its identity. The English law relating to entails may be considered under three heads:

I. The doctrine of "estates" in land; II. the practice of making settlements of land; III. the modifications recently made in the law relating to land.

I. The unity of ownership, so prominent in Roman law, is almost lost in the feudal land law. In England land is not technically an object of private ownership, since the crown is supreme lord of all the land of England. Private persons can only have *estates*, *i.e.* interests more or less extensive in land. Many different persons may have estates or interests in the same piece of land. In freehold land there are three different estates: (*a*) estate in fee simple, (*b*) estate tail, (*c*) estate for life. Estate in fee simple or an estate *to a man and his heirs* is practically, although not technically, the same thing as full ownership. The tenant in fee simple has the fullest power of enjoying and disposing of the land. An estate tail is an estate to *a man and the heirs of his body*, *i.e.* to a man and his descendants. It may be an estate in tail male, *i.e.* descending only to male offspring, or an estate in tail female, *i.e.* descending only to female offspring, or an estate in tail special, *i.e.* descending only to offspring by a particular wife. But estates in tail special, are, in practice, very uncommon. When the offspring of the tenant in tail are all deceased, the estate tail is at an end and the land reverts to the grantor of the estate tail or to his representative. Thus an estate tail is a smaller interest in the land carved out of the fee simple estate. When there is an estate tail in one party there must be a reversion in fee in another party. An estate given to a man and the heirs of his body was at first regarded as a fee simple estate given conditionally upon the birth of issue. When the tenant had issue he acquired the right of alienating so as to defeat the rights of his heirs and also of the reversioner. By the statute De Donis Conditionalibus (13 Ed. I. c. 1), the power of alienation was entirely taken away. But within two centuries the lawyers invented methods of evading the statute, namely, the collusive actions known as Fines or Recoveries, whereby the tenant in tail could once more alienate his land, and defeat the rights of heirs and reversioners. By the Act for the Abolition of Fines and Recoveries (3 & 4 Will. IV. c. 74), these actions were superseded and the tenant in tail was enabled to attain the same object by simply executing a deed to that effect and having it enrolled in

a public office. Thus a tenant in tail can turn his estate tail into an estate in fee simple, and acquire virtually unrestricted ownership. An estate for life does not descend to offspring of the tenant, and cannot be enlarged so as to extinguish the rights of the reversioner. The position of the tenant for life at common law, and previously to certain modern statutes, was that of a usufructuary, who might enjoy the income, but might not change the character, much less impair the capital value, of the property. Thus he could not open mines, fell timber, or plough up old meadow land. Nor could he dispose of the land by way of gift, sale, or exchange, or lease it for more than a very limited period. He has been recently invested with very wide powers which will be explained later on.

II. The settlements of real estate in use date from the 17th century. When a landowner executes a settlement, he usually reserves a life estate to himself and gives an estate in tail to his eldest son with remainders in tail to his other sons. The eldest son, when born, acquires an estate in tail to take effect after his father's death. Such a future estate in tail cannot be barred without the consent of the tenant for life, who is called the protector. If the son held out till his father's death, he would become tenant in tail in possession, and then could bar the entail and get an estate in fee simple. But whilst his father lives he has nothing. Therefore, when he wants an establishment of his own, he has every reason to join with his father in making a new settlement similar to the old one. Thus the perpetuation of an estate in the same family is ensured. But the powers of a tenant for life at common law were not enough even for the proper management of an estate. In every well-drawn settlement there were appointed trustees, invested with powers of selling, exchanging, or leasing parts of the estate and of executing permanent improvements and charging the estate with the cost thereof. These powers the trustees were to exercise only with the consent of the tenant for life and with a view to the interest of all persons entitled under the settlement.

III. The modifications recently made in the law amount to bestowing upon the tenant for life powers similar to those bestowed upon the trustees by the settlement. A series of statutes of Queen Victoria's reign ending with the Settled Land Act of 1882 has annexed to the character of tenant for life the fullest powers of alienating the whole or parts of the estate, and of employing the proceeds either to buy other land or to pay off encumbrances on the fee simple, or to make permanent improvements, or to invest in certain specified securities. The tenant for life now combines two totally distinct characters: his former character of usufructuary, and his new character of trustee for all parties (himself included) who have an interest under the settlement. The settled estate is now to be regarded not so much as land, but as capital which happens to be invested in land, but may be invested otherwise at the discretion of the tenant for life. It remains to notice the objections made by economists against systems of entail generally, and to consider how far they are applicable to the system of entails now existing in England. These objections are principally two: I. entails check the improvement of land; II. entails restrict the transfer of land.

I. Entails check the improvement of land, and so lessen the wealth of the community; because the limited owner, as compared with the absolute owner, has (*a*) less motive to improve and (*b*) less power of improving. (*a*) The limited owner has less motive to improve his land, because he cannot dispose of it by sale or testament, and because the property will all go to one son, without affording a provision for the other children. Hence the limited owner is exposed to the temptation of desiring to apply the whole income of the land, either to his own purposes or to making a provision for daughters and younger sons. The English tenant for life cannot now be deprived of the power of selling his land, but he can touch only the income of the proceeds. This objection, therefore, is lessened rather than removed by recent legislation. (*b*) The limited owner lacks power to improve the land, because (i) his freedom of action has been narrowly regulated by law. (ii) His land may have been encumbered with charges created in favour of other members of his family, which lessen the net income; (iii) he has to make provision for children other than the heir, and is thus further straitened.

(i) The English tenant for life (see Settled Land Act, 1882), has now the legal right to do almost anything which the tenant in fee simple could do. His means for permanent improvement are now much greater than they were formerly, since he can sell part of his land in order to raise capital for improving the rest. He can do this without impoverishing his younger children, as the land which he sells would under the settlement have gone to the eldest son. (ii) The charges on the land to provide a jointure for the widow of the late tenant for life, and portions for the younger brothers and the sisters, are not affected by recent legislation. They form deductions from the gross income of the tenant for life, and lessen his means of improvement. (iii) The tenant for life still has to provide for his younger children, and may thus be tempted to set apart for them money which might with advantage be spent on improving the land. Recent legislation, therefore, whilst much enlarging the powers of improvement possessed by a tenant for life, has

not put him upon an equality in this respect with the tenant in fee simple.

II. It is said that a system of entail deprives landowners of (*a*) the power, (*b*) the motive to sell their land, and thus produces the following evils:—(i) the retention of land in the hands of persons who may be too impoverished to improve it; (ii) the exclusion of capital from being employed in the improvement of land which under a system of free sale would be purchased by capitalists; (iii) a restriction in the number of landowners, which diminishes the stability of society; and (iv) the removal of a strong motive to industry and economy in the labouring class, namely, the hope of becoming the owner of a piece of land.

That the power to sell is wanting, under a complete system of entail, is clear. That it is not wanting under the modified system of entail now existing in England is also clear. The motive to sell is still wanting to the tenant for life, in so far as he cannot appropriate the capital sum paid by the purchaser. But, since his income is much reduced by prior charges, and by the necessity of saving for children other than the heir, he has the strongest inducement to exchange an investment like land, which at the present day rarely pays more than 2 per cent, for investments like railway debentures, which pay 3 per cent. For the increase of return all goes to swell his income, the charges upon it remaining the same.

Under the Settled Land Act, a good deal of land has been sold in England. But hitherto land has been offered for sale mostly in large masses. For this there are several reasons:—(i) the influence of habit upon those who conduct the sale of land; (ii) the extravagant expenses connected with making out a title, which may be as heavy for a small piece of ground as for a large estate, and so act as a prohibitory tax on sales of small parcels; (iii) the present condition of the market for agricultural produce which represses any strong desire, in the English middle or lower class, to become freeholders. Energetic persons engaged in agriculture prefer to employ their capital in working a large farm rather than in buying a small one. Other small capitalists dislike so risky and unproductive an investment as land is at the present time. For all these reasons the estates which have come into the market have generally been bought undivided by wealthy men who can afford to place great sums in a sort of property which gives social consideration and out-of-door amusement, but yields only a paltry return in money. Thus the sales which have taken place in England are not believed to have much increased the number of landowners. In Wales, the tenants sometimes buy their farms when offered for sale. In Ireland the tenants are almost the only purchasers. In those countries the number of landowners is thus increasing. Moreover, as small owners rarely make family settlements, an increasing part of the land in Wales and Ireland is no longer subject to a system of entails, but is held by tenants in fee simple.

[For the legal learning of entails, the reader may consult Kenelm Digby's *History of the English Law of Real Property*.—Williams' *Law of Real Property*.—Goodeve, *Modern Law of Real Property*.—*The Land Laws*, by Sir Frederick Pollock (English Citizen Series), and many other text-books, together with the statutes and leading cases to which they make reference. Some interesting observations upon the rise of feudal systems of tenure, upon entails and primogeniture, will be found in Maine's *Ancient Law*, ch. vii., and *Early Law and Custom*, ch. ix.

Of the writers who have considered entails in their economic aspect, only a few can be mentioned here: Adam Smith, *Wealth of Nations*, bk. iii. ch. ii., who dwells on the injustice to younger children caused by entails, and asserts in terms much too absolute the improbability of a great proprietor executing great improvements.—M'Culloch, *Principles of Political Economy*, who justifies primogeniture by its effect in raising the fashionable standard of living, and so giving an impetus to the pursuit of wealth.—Mill, *Principles of Political Economy*, bk. v. ch. ix., who condemns entails partly as encouraging idleness and extravagance, partly on the grounds above explained at length.—Boyd-Kinnear, *Principles of Property in Land*.—Cliffe Leslie, *Land Systems and Industrial Economy*.—A volume of the Cobden Club Essays, entitled *Systems of Land Tenure in various Countries*.—George Brodrick, *English Land and Landlords* (also included in the Cobden Club Essays).—Shaw Lefevre, *English and Irish Land Questions*.—Arthur Arnold, *Free Land*.—Kay, *Free Trade in Land*, etc. None of these writers can be said to have fully considered the latest stage of the English law relating to this subject, and therefore many of their criticisms are partially obsolete.] F. C. M.

[Refer for other sides of the question to BEQUEST, POWER OF; MORCELLEMENT.]

ENTAIL (SCOTLAND) anciently and still sometimes called tailzie, from Lat. *talliatum*, cut off; any deed by which the ordinary legal course of succession is cut off and a fresh one substituted. The power to create an entail, previously doubtful in Scotland, was definitely given by the act 1685 c. 22. Every proprietor in fee since that date may grant a simple destination which merely names a succession of heirs, each one of whom may dispose of the estate as he pleases, and whose successor in the destination merely takes in default of such disposition, or he may protect the succession he prescribes by restrictive clauses forbidding any interference with the succession by selling, alienating, or disposing of the lands, contracting debt, or doing any deed whereby the succession might be frustrated. These clauses must be inserted in all title-deeds, and the entail with the judicial authority of the court of session

must be recorded. Every act or deed contravening these restrictions was declared null, and the real heir might, on contravention, take up the estate. In 1770 the heir in possession of entailed lands was allowed a modified power of leasing, and of charging against future heirs a proportion of the expense of improvements on the property by the Montgomery Act, 10 Geo. III. c. 51. Further relaxations were granted in 1824 by the Aberdeen Act, 5 Geo. IV. c. 87, enabling an heir of entail in possession to make limited provisions in favour of a husband or wife or children, which were payable by the successors out of the yearly rents or proceeds, but did not affect the fee of the entailed estates; by the Rutherfurd Act 1848 the fee may now be charged in favour of younger children. But no powers either under the Montgomery Act or the Aberdeen Act could be exercised so as to deprive the successors of more than two-thirds of the free yearly rents. In 1836 the Rosebery Act, 6 & 7 Will. IV. c. 42, gave the heir in possession a limited power to sell parts of the estate for the entailer's debts under the authority of the court of session. In 1848 the Rutherfurd Act, 11 & 12 Vict. c. 36, first conferred on an heir of entail in possession the power to disentail. Elaborate and intricate provisions were made by the Rutherfurd Act distinguishing between entails made before and after its date, and heirs in possession who were born before or after that date, with regard to the consents required to disentail. Broadly speaking, if the heir in possession was born before the act and the entail was made before the act, he requires the consent of all the heirs if less than three, or of the next three heirs, or of the heir apparent and two of the heirs who would, including the heir apparent, be successively heirs apparent, provided the nearest heir be twenty-one years old; or if such consents be refused by any heir, even, since 1882, the nearest heir for the time, the court may assess the value of the heir's interest and dispense with his consent on the payment to him of the value of his interest, or sufficient security for such payment. The next heir in succession thus receives a lump sum for his expectancy instead of getting, as in England, the interest of the purchase money if and when he succeeds in lieu of his interest in the land. The distinction between old and new entails is now removed. Other powers now possessed by heirs in possession of entailed estates are—to sell under the same conditions as those of disentailing, to excamb, or exchange, any portion of the entailed estate for an equivalent in contiguous lands, without any consent, taking or giving not more than £200 for equality of exchange, to grant feus and leases, to charge improvements, and to charge family provisions in favour of the wives, husbands, or children of heirs of entail in possession.

[Rankine, *Land Ownership*, chap. xxxiv.—Bell's *Principles*, § 1716, *et seq.*—Duff on *Entails*.—Duncan on *Entail Procedure*.] J. W. B. I.

ENTREPÔTS. A term applied in France and other countries to places of deposit for goods, analogous to the bonded warehouses in the ports and trade centres of the British Empire. In them articles subject to custom or excise duties may be placed, until time of payment of the imposts to which they are liable on delivery for consumption, or until removal for the convenience of trade, or exportation to foreign countries. In the latter case the importers are relieved altogether from the necessity of the revenue payments, and in the others this outlay need not be incurred until such time as the consumers are ready for their use. In this country, where an immense transit trade centralises, where the operations are often of great magnitude, and the few duties retained are great in proportion to the prime cost of the articles, the facilities afforded by this system permit of much trade being carried on which would otherwise be cramped or altogether prevented. The use of capital is economised, and excessive fluctuations in price are checked by the large stocks it is possible to retain on hand, as well as the speed with which supplies may be transferred to the consumers, at a lessened cost for time and money expended. On the other hand, the care bestowed upon their safe custody, and the supervision of the necessary operations, such as sorting, vatting, and other processes, constitutes a charge upon the revenue for the benefit of the consumer or trader.

These observations apply with much greater force to the "entrepôts" established in France and elsewhere, because of the multitude of articles which have, for the security of the revenue, to be taken in charge, at a considerable cost if the supervision be effectual, or of risk if it be insufficient. There, too, it is not only the national revenue which, as here, has to be safeguarded, but also the municipal tolls in the shape of *octroi*. It is mainly this which has led to the division of these *entrepôts* into "*réels*" where the goods are actually kept in custody, and "*fictifs*," nominal or conventional, where the owner has them in his own charge, but is answerable for the payment of the duties to which they are liable. See also BONDED WAREHOUSES.

[*Nouveau Dictionnaire d'Économie Politique*, 1891, vol. i. p. 898; and *Dictionnaire des Finances*, 1889, vol. ii. p. 118.] S. BO.

ENTREPRENEUR. An alternative name for the employer (see EMPLOYERS and EMPLOYED). Adam Smith (*Wealth of Nations*, bk. i. ch. vi.) used the term "undertaker," and J. S. Mill (*Political Economy*, bk. ii. ch. xv. § 1 footnote), expresses his regret that "this word, in this sense, is not familiar to an English ear." He adds that "French political economists enjoy a great advantage in being able to

speak currently of 'les profits de l'entrepreneur'"; and it seems that, partly perhaps in consequence of this, political economy has in France avoided the mistake committed by some of the older English economists in failing to distinguish the functions of the employer and his share in the produce of industry as such from the functions and share of the capitalist as such. General F. A. Walker (*Wages Question*, ch. xiv.) echoes Mill's regret that "we have not a single English word which exactly fits the person who performs" the office of the employer in modern industry. "The word undertaker," he remarks, "at one time had very much this extent," and so had the word "adventurer." But they have since acquired other senses. The "French word entrepreneur," however, he adds, "has very nearly the desired significance, and it may be that the exigencies of politico-economical reasoning will yet lead to its being naturalised among us." L. L. P.

[See also FRENCH SCHOOL.]

ENTRY, BILL OF. The name given to an office within the custom house at London, and other ports of the United Kingdom, from which there issue daily lists of ships arriving and sailing, with accounts of their cargoes, deliveries from bonded warehouses, and other particulars of considerable interest to the mercantile community. In addition to these printed publications, manuscript accounts are rendered to those who may desire such special information as can be gleaned from the customs records, or may be compiled from the various documents and forms supplied for customs purposes. The printed lists are sold to subscribers, and the special returns are paid for in proportion to their length or the trouble involved in their preparation, for the exclusive use of those at whose expense they are compiled.

The history of this arrangement is somewhat peculiar; it is, or was until recently, a remnant of the old times when special privileges were conferred on favoured individuals for their pecuniary advantage, or in return for payments made by them. One of these acquired, in 1660, by letters patent, the exclusive right of access to all official documents connected with the customs reports and entries, and of obtaining and publishing any portion of the information they furnished. Ultimately, in 1817, this right became vested in the Customs Annuity and Benevolent Fund—a mutual insurance fund supported by payments of the officers themselves, supplemented by the profits of the bill of entry, and devoted to the sole benefit of their widows and orphans. Through the energy and wisdom of the directors this had grown to be a valuable business, which, at the expiration of the crown patent, in 1880, the treasury appropriated to its own benefit, and it is now profitably carried on by the commissioners of customs. The public funds thus became possessors of a private property created by independent exertions on behalf of a charitable purpose.

The existence of such a source of information is of great advantage to merchants, statisticians, traders, and shipowners, by enabling them to obtain correct knowledge on points too minute, too varied, and too numerous to be set forth in the periodical returns of trade and navigation laid before parliament.

[*Reports of Commissioners of Customs.—Bill of Entry*, Journals A and B.—Bourne, *Royal Statistical Society's Journal*, vol. xxxv. pp. 214-215, 1872.] S. BO.

ENTRY, RIGHT OF. The payment of the rent, and the performance of the covenants in a lease, are usually secured by a "condition or proviso for re-entry," which enables the landlord on non-payment of the rent or non-performance of the covenants, to take possession of the premises let, as if no lease had been made. The courts of equity and the legislature have, in a certain measure, succeeded in preventing landlords from making any oppressive use of this power. Thus a tenant who has been ejected in consequence of the non-payment of rent may be reinstated if he pays the rent and costs within six months after the execution of the judgment. As regards the non-performance of covenants, not relating to the payment of rent, and not belonging to one of the excepted classes referred to below, a right of re-entry or forfeiture is not enforceable unless the tenant has failed to comply with the terms of a notice specifying the breach and requiring him to remedy it and to pay compensation in money in respect of it (Conveyancing Act, 1881, § 14). In such cases forfeiture is therefore impossible, except when the breach is wilful and persistent. The rule just mentioned does not, however, extend to covenants against assigning and underletting, and the omission to obtain the landlord's consent to an assignment or underlease of the premises may lead to the forfeiture of the lease although it was due to forgetfulness on the part of the tenant's solicitor, and although the landlord would not, under the circumstances, have withheld his consent if asked for (Barrow *v.* Isaacs [1891], i.; Queen's Bench, 417). The attempts to induce the legislature to enact some provisions more favourable to tenants in respect of such covenants have proved abortive, and their only result has been § 3 of the Conveyancing Act of 1892, which provides that in the absence of an express agreement to the contrary, a landlord shall not make his consent to an assignment or underletting dependent on the payment of a sum of money beyond a reasonable amount in respect of expenses. Conditions for forfeiture on the bankruptcy of the tenant, or on the taking in execution of the tenant's interest, were also originally excepted from the rule granting relief

as stated above; but it is now provided by §§ 2 and 3 of the Conveyancing Act of 1892 that, subject to certain exceptions, a lease is not to be forfeited in such a case, unless the tenant's interest remains unsold within a year after the date of the bankruptcy or of the taking in execution. The practical importance of the exception is materially reduced by this alteration. E. S.

ENUMERATED COMMODITIES. This term has two distinct meanings, according as it is applied: (1) to the European trade of England; (2) to the colonial trade of England. In both cases it refers to commodities which were originally enumerated in the Navigation Act of 1660, but which were altered from time to time by subsequent legislation.

(1) With regard to the European trade, the first Navigation Act in 1651 forbade the importation of European products except in British ships, or ships of the country where the goods were produced, or from which they could only be, or most usually were, exported. The second Navigation Act in 1660, while adopting most of the provisions of 1651, modified this particular article. It renewed the restriction about importation to (1) all Russian and Turkish products, and (2) certain enumerated commodities: viz. timber, salt, pitch, tar, rosin, hemp and flax, raisins, figs, prunes, olive oils, all kinds of corn or grain, sugar or potashes, wines, vinegar and spirits (12 Car. II. c. 18, § 8). All other European goods could be imported in any vessel. Two years later a further restriction was made, and it was provided that certain goods should not be imported into England in any ship whatever from Germany, Holland, and the Spanish Netherlands. This second list of enumerated commodities included all wines other than Rhenish, spices, grocery, tobacco, potashes, pitch, tar, salt, resin, timber, and olive oil (13 & 14 Car. II. c. 11, § 23). Changes in the enumeration were made at intervals in obedience to momentary pressure or changing interests. But no great relaxation of the system of 1660 and 1662 was made till 1822, when the importation of enumerated goods was extended to ships of the country or place from which they were imported; and at the same time the exceptional restrictions upon trade with Germany, the Netherlands, Russia, and Turkey, were abolished (3 Geo. IV. c. 43, § 6). The distinction between enumerated and non-enumerated commodities disappears altogether after the repeal of the Navigation Act in 1849.

(2) As applied to the colonial trade, the term enumerated commodities had an equally important significance. The act of 1660 limited all trade, both of export and import, with British plantations in Asia, Africa, or America to British ships. But it added a distinction between those colonial products which could only be carried to England and those which might be carried, still in British ships, to countries other than England. The former, which are the enumerated commodities in this connection, naturally included all those commodities which England did not produce herself, or did not produce in sufficient quantity for her needs. The non-enumerated commodities, which included all those goods in which the home producers dreaded colonial rivalry, were originally allowed to choose any market outside England, but were ultimately limited to countries south of Cape Finisterre. The motive for this restriction was to prevent the manufacturing rivals of England from obtaining raw materials from our colonies. These and other oppressive regulations with regard to colonial trade were undoubtedly a chief cause of the revolt in 1774 of the American colonies, whose success dealt a fatal blow at the policy of the navigation acts, and in 1796 the United States were allowed to carry their goods in their own ships to Great Britain. In 1822, the distinction of enumerated commodities among colonial products became obsolete, and the colonies were allowed to export not only their own produce, but their imports from other countries, to any place in Europe, Africa, or America, either in British ships or in ships of the country to which they were exported (3 Geo. IV. c. 44, § 4, and c. 45, § 2).

[M'Culloch's edition of Adam Smith, note xi., and Leone Levi, *History of British Commerce*, pt. iii. ch. ii., give a clear account of the enumerated commodities in European trade. For the term as applied to colonial products see Adam Smith, *Wealth of Nations*, bk. iv. ch. vii. pt. 2.] R. L.

ÉPHÉMÉRIDES. About the middle of the 18th century proposals for reform both in finance and agriculture began to interest the French public. In 1751 a special review, the *Journal œconomique ou Mémoires, Notes et Avis sur l'agriculture, les arts, et le commerce*, was established in order to deal with these subjects. This journal contained essays both on practical and theoretical questions; the latter presenting restrictive as well as liberal views. Recommendations of free-trade in corn, and translations of works of English economists, as Josiah Tucker and Hume, strengthened the position of the French school of free trade who became afterwards the physiocrats. The *Gazette du Commerce*, established in April 1763, admitted the contributions of Le Trosne and St. Péravy as well as those of their opponents. The government, favouring these discussions on the corn policy, bought up this newspaper and connected with the *Gazette du Commerce* a special review, the *Journal de l'Agriculture, du Commerce, et des Finances* (1764). This *Journal* soon passed into the sole possession of the physiocrats and was their organ from September 1765 to November 1766. It ceased to appear in 1783.

Among the periodicals treating on subjects akin to those dealt with by the *Journal de l'Agriculture* was a weekly paper, the *Éphémérides du Citoyen ou chronique de l'esprit national* (6 vols. 12mo), established in December 1765, after the model of Addison's *Spectator*, by the Abbé Baudeau. He intended through its means to defend the interests of "humanism" by pleading for the abolition of slavery in the colonies. He, however, employed his organ to attack the Economists, professing for his own part mercantilist views and a detestation of free-trade. Le Trosne replied in the *Journal de l'Agriculture* of March 1766 to Baudeau; the latter answered, but soon desisted, for, after reading but half a page of Le Trosne's private observations on the futility of the "balance of trade," he abandoned his intention of continuing these polemics. Shortly after this the Marquis of Mirabeau brought Baudeau fully to agree with the physiocratic school. This event, *le saut de la science*, proved very important for the progress of the Economists. For the *Éphémérides* was ready to receive their contributions just at the time that the editor of the *Journal de l'Agriculture* put difficulties in their way (December 1766). After January 1767 the new organ appeared as a monthly review under the title *Éphémérides du Citoyen, ou Bibliothèque raisonnée des Sciences morales et politiques*. Baudeau remained its editor till May 1768, when his place was taken by Du Pont de Nemours. The most eminent writers of the physiocratic school contributed to this journal. Among the most interesting articles are the following:—Quesnay's "Essays on the Government of Peru" (1767, t. i.); he declares that the system of tithes in Peru proves its ancient government to have been the most prosperous and the fairest in the world.—On "Despotism in China" *signed* M.A. (1767, t. iii., iv., v., vi.), in which he describes Chinese political institutions as exhibiting "an order of essential stability," besides minor articles (1767, t. x., 1768, t. ii.); cp. Oncken's edition of Quesnay's *Œuvres*, pp. 660-692.—Mirabeau's "Letters on the Legal Order." In these he undertakes to give an historical account of the causes of economic legislation, and the study of the "physical" causes leading towards its reform (1767, t. ix., x., xi., xii.; 1768, t. i. to vi., viii. to xii.; 1769, t. i. to iii., v.).—On the economic education of girls; insisting upon the necessity of instructing them in the science of the natural social order (1768, t. iii.).—Dialogues between a child and its teacher, on the use of science to princes (1769, t. vi. to ix.).—Historical eulogies on Sully, whose merits as statesman and as a predecessor of the physiocratic school are dilated on (1770, t. iii. to xii.; 1771, t. i. to xi.).—Baudeau wrote "Avis au peuple sur son premier besoin," treating of a free trade in corn, the best manner of baking bread, and on its price (1768, t. i., ii., iv., v.). "Avis aux honnêtes gens, qui veulent bien faire," dealing with the effects of the bad harvest of 1769, and the methods pursued to cheapen the price of bread (1768, t. x., xi.; 1769, t. x.). An Explanation of the Tableau Économique to Madame de—— ("political economy made easy") (1767, t. xi., xii.; 1768, t. viii.; 1770, t. ii.). On luxury, its destructive effects on agriculture (1767, t. i. to iii.). "On the actual state of Poland," on the causes leading to its destruction by the Moscow policy (1770, t. ii. to iv., xi.; 1771, t. i., iii. to v.).—There are also some observations by Butré respecting agriculture on a large and a small scale, illustrated by accounts of farms and estates cultivated on the Métayer principle, and proving the unprofitable character of the latter (1767, t. ix., xi., xii.).—Among Du Pont's contributions his "Notice abrégée" containing the first sketch of a history of economics, particularly deserves mention (1769, t. i. to iv., vi., ix.; 1770, t. i. *avertissement*).—Among the latest important articles were Turgot's "Réflexions sur la formation et la distribution des richesses" (published in 1769, t. xi., xii., and 1770, t. i., but written in November 1766) and the "Abrégé de l'économie politique" by the Margrave of Baden-Durlach (1772, t. i.).—Minor articles were written by Roubaud, St. Péravy, Le Trosne, Morellet, Franklin.—Criticisms are also included directed against Linguet (1767, t. iii.; 1770, t. i.), who, in his *Théorie des lois civiles*, 1767, had taken no notice of the physiocratic conception of natural law, and in accordance with Hobbeism had declared that "l'esprit des lois—c'est la propriété"; Forbonnais, who is censured on account of his attacks against the physiocratic theory that trade was a simple exchange and not affording a "produit net" (1767, t. vi., ix.);—against the attempted refutation of their doctrine by Graslin, the author of an *Essai sur la Richesse et sur l'Impôt* (1768, vol. ii., iii., x.);—against the *Doutes adressés aux philosophes économistes* by Mably, who had from the communistic standpoint attacked the foundation of this system, the right of private property (1768, t. ii., iii., v. to viii.; 1769, t. v.).—The *Éléments généraux de Police* of Justi (1769, French edition), is shown to be a work of very shallow and contradictory views, which maintains the wisdom of grandmotherly regulations (1769, t. ii., iii.); Galiani's *Dialogues sur le Commerce des Bleds*, one of the wittiest productions of economic literature, is described as "un ouvrage charmant, qui renferme les plus jolis lazzis du monde" (1769, t. xi., xii.); Baudeau also criticised Beardé de L'Abbaye's *Recherches sur les moyens de supprimer les impôts, précédées de l'examen de la nouvelle Science*, 1770, a criticism directed against the single-tax theory (1770, t. vii.); and Pinto the mercantilist "Pindar of the stock exchange" (*Traité de la circulation et du*

crédit, 1771), (1771, t. x.). Besides these articles the review contained a chronicle of public events considered to be symptoms of the progress of the doctrine of the physiocrats: this includes the utterances of the French *parlements* in the provinces on the corn-trade; the emancipation of serfs in Denmark; the encouragement given publicly to agriculture by the heir-apparent of the crown (Louis XV. being king), the Dauphin Louis, who on the 15th June 1768 himself held the plough at Versailles (1768, t. vii.; 1769, t. viii.). Louis was followed in this by the Emperor Joseph II., who drove a peasant's plough, the 19th August 1769, at Slavikovitz in Moravia (1770, t. xii.). These events have been commented on by Diderot in a review which he wrote about the *Éphémérides*, in the following words: "Plough, plough as much as you will; I promise you that as long as matters stand on their present footing, the wheatsheaf growing under your royal hands will not nourish your peasants" (*Œuvres*, t. iv. p. 85). An account is given of an experiment made by the Marquis of Mirabeau and his son at Aigueperce in Limousin, to form a *bureau de conciliation*, composed of prud'hommes elected by the parishes, in order to avoid the frequency of lawsuits. The experiment was imitated by the Marquis de Sérent at Malestroit in Bretagne; it was a precursor of the modern boards of conciliation (1771, t. iii. p. 110-194; t. vii. p. 183, cp. Loménie, *Les Mirabeau*, t. ii. p. 79; t. iii. p. 59). This part of the *Éphémérides* contains some statements about financial reforms in foreign countries, especially of the experiment of a "single tax" on land (*impôt unique*) in Baden (1771, t. iv., v., vi., vii.), with the performance of which Schlettwein was entrusted in the village of Dietlingen (1770) (see IMPÔT UNIQUE).

The *Éphémérides* was suppressed by the Controller-Général, the Abbé Terray, in November 1772 (t. iii. is the last of the sixty-three volumes of this series). The editors sought in vain to connect themselves with other journals. It is characteristic of him that, after being forbidden to publish the *Éphémérides* in 1772, Du Pont continued to work in their line by issuing a fortnightly *Correspondance littéraire et politique* in MS., and to send transcripts to the monarchs interested in the physiocratic doctrines (cp. *Carl Friedrichs von Baden briefticher Verkehr mit Mirabeau und Du Pont*, edited by Carl Knies, Heidelberg, 1892, vol. i. p. 151-152; cp. also vol. i. pp. 21, 56, 57, 61; vol. ii. p. 109 *seq.*, 197). After a three years' silence Turgot, who had become minister, enabled the Abbé Baudeau to resuscitate the review. It thus became almost an official organ intended to explain and justify Turgot's politics. In December 1774 appeared the first part of these *Nouvelles Éphémérides Économiques, ou Bibliothèque raisonnée de l'Histoire et de la Politique* (18 vols., 12 in 1775, 6 in 1776). The *Journal de l'Agriculture* too became again an organ of the physiocratic school under the direction of Abbé Roubaud. Among the contents of the *Nouvelles Éphémérides*, the following are remarkable: "Letters and Memoirs written to a Magistrate of the Paris Parliament on the Arrêt of September 13th, 1774," by Baudeau (1775, t. i.) This is an historical and theoretical interpretation of the causes which lead on to Turgot's celebrated ordinance, by which the free circulation of corn in the provinces of France was established and its free exportation abroad was made the object of future decisions of the government (see Turgot, *Œuvres*, 1844, t. ii. p. 169).—Bigot de Ste. Croix's posthumous *Essay on the Abuse of Exclusive Privileges, on the Freedom of Trade and Industry* (1775, t. i. iii.), is a literary forerunner of the abolition of corporations by Turgot.—The third part of vol. i. (1775) opens with an *Éloge funèbre de M. François Quesnay*, delivered by the Marquis de Mirabeau four days after the master's death, the 20th December 1774. T. v. of the same year contains an historical eulogium of Quesnay by the Count d'Albon.—Baudeau again contributes inquiries and historical memoirs on the finances of France from Louis XII. to Louis XV. (1775, t. ii., iii.), and a refutation of an author who had written in defence of the Corvée system.—The Marquis de Pezay writes an essay on *The Fortification of the Military Frontiers of Alsace*.—Fréville inserts a translation of extracts from A. Young's *Eastern Tour through England* (1775, t. ii. iii.), and *On the Present State of British Commerce* (1775, t. viii.) Turgot's ordinance, which allows again leases of twenty-nine years' duration (January 2, 1775) is published as a memorable event (t. ii.).—The general aspects of the school are dealt with in a *Letter on the Economists* (1775, t. iii.); in this the contrast between formal liberty, adhered to by the economists, is contrasted with the postulate of economic equality and the latter declared unnatural. Still the fundamental principle of the economists is declared to be the truth, that "the particular happiness of individuals can only be reasonably and firmly established upon the basis of the general happiness of the whole race" (1775, t. iii. p. 59). The philosophical and political ideas of the physiocratic school are embodied in a *Memoir on Public Instruction* by Mercier de la Rivière (1775, t. ix. x.), and in Roubaud's *Political Reflections on America* (1776, t. iii.), which are full of sympathy for separation of the colonies from England.—Finances are dealt with in *Reflections of a Citizen on the financial administration of great cities, and especially of the City of Lyons* (t. iv.), written to oppose indirect local taxation; they exhibit the destructive tendency of the physiocratic doctrine for local life by subjecting it to central government. An essay

is directed against the heavy taxation of tanneries after 1759 (1775, t. iv., also 1776, t. iv.), and of salt, spirituous liquors and tobacco; this essay, *Le Profit du Peuple et le Profit du Roi*, had been previously written in 1769 by Baudeau, and twelve copies only printed, 1775, t. iv.; cp. a letter to Baudeau on that subject in 1775, t. x., extracted from *Nouvelles de la République des Lettres* (Lausanne, vol. i. 1775); cp. also the criticisms on Baudeau's essay contained in *Nouv. Éph.*, 1776, t. ii. p. 70, taken from the *Journal Encyclopédique* of 1775, vol. viii. Other articles deal with the suppression of the duty on fish coming to Paris during Easter-time (1776, t. iv., and Turgot, *Œuvres*, ed. Daire, vol. ii. p. 402), and the suppression of a series of duties in Russia by Catherine II. (17th (28th) March 1775, t. vii.). Historical details are given relative to duties laid on eggs, butter, cheese (1776, t. i.), on wines coming to Paris (1775, t. v.), and likewise on such imports within Champagne (1776, t. iii.). A new method of levying the duty on brandy is described, and the weight of the impost of 1771 on the manufacture of paper, 33 per cent on the cheapest sorts, is complained of (1776, t. v.). A document, proving the antiquity of complaints on French finances, from the year 1415, is published in 1775, t. xi. An essay of Baudeau, written in 1768 was published for the first time in 1776, t. i., on the occasion of the abolition of the "Caisse de Poissy" on the 9th February 1776 (see Turgot, *Œuvres*, vol. ii. p. 316); this institution since 1743 had farmed the exclusive market right of meat for Paris to a company, which was entitled by it to take a duty of 6 per cent upon all sales of meat at Sceaux and at Poissy. Baudeau's article produced great irritation among the partners in the company, who brought an action against its author; the text of the latter is inserted in *Nouv. Éph.*, 1776, t. vi. This volume also contains a "memoir on the taxes raised in unforeseen cases ('affaires extraordinaires') in France during the war of 1756-1763." They amounted to no less than 1,105,227,761 livres.

The free-trade movement is represented by a memoir written by M. Belly on the decline of the trade of Leghorn in consequence of the number of charges (1775, t. vi.); the same author contributes an essay on the state of commerce and manufactures in Italy (t. vii.) The obstacles to the shipping trade in the Rhone (1775, t. ix., t. xi.), and to the exportation of iron (1776, t. iv.), are complained of, and a petition of the Guyenne chamber of commerce for free trade to the East Indies is published (1776, t. iv.).

Among the events favourable to the economists the following are worth mention:—The correspondence of King Gustavus of Sweden (when a youth) with Count Tessein and Scheffer, published by Col. St. Maurice de St. Leu (1775, t. iv., 1776, t. ii.); the foundation of a "Société d'émulation" in Paris after the model of the London "Society for encouraging arts and manufactures," the rules of which are contained in 1775, t. ix. The economic reforms introduced in Tuscany by the Grand-duke Leopold, and enumerated in *Saggi di Agricoltura; di un Paroco Siamminiatese*, Florence 1775, are favourably reported on. Among these the erection of a kind of co-operative store at Florence for the sale of all sorts of goods deserves mention; upon the abolition of corporations it was imitated at Paris by the Bureau de Correspondance Générale, March 1776 (*N. Éph.* 1776, t. iii. p. 177). The publication of *Ephemeriden der Menschheit* by Isaac Iselin at Basel is chronicled with enthusiasm by Baudeau.

The literary movement is represented by a lengthy criticism of Necker's book, *Sur le Commerce et la Législation des Grains*. It marks the distinct contrast between social protectionism and the spirit of individual property; the contrast between landed and moneyed "capitalism." (*Éclaircissements demandés à M. N——, au nom des Propriétaires Fonciers et des Cultivateurs français* 1775, t. v. 65-168, t. vii. 89-167, t. viii. 93-139, and Baudeau's letters to M. N. on his "Éloge de Colbert," held at the French academy in 1774, t. ix. pp. 44-106). A letter directed against the free-trade theory of the economists by the Count de Magnières (t. xii.) is refuted by M. de R——(?) in 1776, t. ii.—A review of the book of Condillac, *Sur le Commerce et le Gouvernement* (1776, t. iv. pp. 109-130, t. v. pp. 131-147), written by Baudeau, treats this author as a heretic from the orthodox school. "The true economists are easy to characterise by one feature which everybody understands. They recognise one master (the doctor Quesnay), one doctrine (that contained in the *Philosophie rurale* and the *Analyse Économique*), classical text-books (the *Physiocratie*), and technical terms . . . precisely like the old scholars of China" (p. iii.).

The *Nouvelles Éphémérides* ceased in June 1776, on the dismissal of Turgot from the ministry (12th May 1776), after which date the only organ of the physiocrats was the *Journal de l'Agriculture*, which Roubaud had reconstituted in 1775; but this periodical also came to an end in 1783. Baudeau made a last effort to re-establish his former review, for there are at the Bibliothèque Nationale at Paris three volumes of *Nouvelles Éphémérides économiques* of 1788 (Paris, Onfroi et Royer) extant. These contain attacks against Colbert and Necker, historical remarks on Sully; fundamental questions of economics, inquiries into the origin of taxation among the Greeks and Romans, and on the influence of morals on agriculture by the Marquis de P——(?).

In 1789 appeared *Éphémérides de l'Humanité ou bibliothèque raisonnée des sciences morales.* Tome premier (and last), aux dépens de la Société. This is probably the last utterance of this kind made by the Économistes, and is entirely written by A. F. J. Fréville. It begins with a lengthy exposition of their doctrines (pp. 1-68), contains articles on the principles of taxation (pp. 108-132), and their application to the Austro-Belgian provinces (pp. 337-394); others against Necker's theory of the circulation of riches, as enunciated in his book, *De l'administration des finances en France*, t. iii. ch. xxi. (pp. 284-336). The greater part of the volume deals, however, with political questions; it is filled up with polemics against the champions of absolutism, such as Count Windischgraetz (pp. 68-108, 133-158, 265-284), and with observations on the convocation of the *États généraux* (pp. 159-264). It closes with a philosophical letter on Montesquieu's *Esprit des lois* (pp. 395-400). Constitutional questions being at this time the most prominent ones, and economic problems standing more in the background, this publication ceased with its first volume. The *Journal d'Économie publique, de Morale et de Politique*, edited by Roederer and Morellet appeared August 1796.

The *Éphémérides* thus played an important part in the literary life of economics during the 18th century. As an example it may be mentioned that Lavoisier, in his introductory remarks to his statistics *De la Richesse territoriale du Royaume de France*, printed by order of the national assembly in 1791, and reprinted in 1797 in the *Journal d'Économie publique*, edited by Roederer, mentions Quesnay as having reached the same conclusions as himself, and notes the fact that Quesnay's statistics were the occasion of Voltaire's *L'Homme aux quarante écus.* The *Éphémérides* formed a scientific economic review written with a distinct practical tendency, namely, to struggle for free trade, free enterprise, and equal taxation; to combat the crushing burdens imposed by commercial restraints, industrial monopoly, arbitrary assessment, and lavish public expenditure. Being in the exclusive possession of a "school," they preserved, in spite of the variety of their contents, a systematic uniformity in method and policy. Besides exhibiting the first example of journalism made subservient to social science, they are the richest source for the history of contemporary economic life, and the growth of modern ideas, not only in France but even in eastern Europe.

Their immediate influence in France was rather short-lived, and after the outbreak of the Revolution they became so entirely forgotten as to enable the tale to be spread that they had been written in order to help Voltaire, Servan, and Bovier to establish a democratic revolution (Abbé Barruel, *Mémoires pour servir à l'histoire du Jacobinisme*, Londres 1797, 2nd pt. pp. 210-215). The interest, however, which the *Éphémérides* excited abroad was a far-reaching one; and by inducing monarchs, statesmen, and landlords to introduce agricultural and financial reforms, to alleviate feudal burdens and commercial restraints, they benefited even the lower classes in Sweden, Denmark, Baden, Austria, and Tuscany. Thus they helped towards transplanting economic progress eastwards both in thought and practice.

[An account of the origin of this review is given in the *Journal de l'Agriculture*, March 1766; in the *Éphémérides*, 1769, t. iv., v.; in the *Dictionnaire de l'Économie Politique*, under the heading "Éphémérides du Citoyen"; in the *Nouveau Dictionnaire d'Économie Politique* the information will be found under the heading "Baudeau." See also Loménie, *Les Mirabeau*, 1879, t. ii. p. 251. Levallois, *Rousseau, ses amis et ses ennemis*, 1865, t. ii. p. 385.—G. Schelle, *Du Pont de Nemours et l'école physiocratique*, 1888, pp. 43, 99, 125, 144, 211, 408. In Germany Mauvillon complained in 1775 of the want of a German economic review of the value of the *Éphémérides* (*Untersuchungen über die Natur und den Ursprung der Reichtümer und ihrer Vertheilung*, a translation of Turgot); only the next year they were imitated by Isaac Iselin, the editor of *Ephemeriden der Menschheit oder Bibliothek der Sittenlehre und der Politik*, Leipzig, 1776-1782. The only known complete set of the *Nouvelles Éphémérides* belongs to the Giessen University Library (pressmark B. 800),—the use of it was most liberally allowed to the writer of this article, in order to enable him to draw up the above statement.] S. B.

(See also Baudeau, Du Pont de Nemours, Physiocrats, Quesnay, and Turgot.)

ÉPICES. The French judges down to the revolution were paid partly by salaries (*gages*), and partly by the payments of suitors (*épices*) The latter were originally voluntary presents in kind, and several of the early kings tried to limit their amount. But in the 15th century the *épices* gradually became compulsory and were paid in money. These payments for justice constituted a considerable indirect tax upon the people, and gave rise to many abuses. It was the interest of the judges to spin out cases so as to increase the charges upon suitors, and thus justice became dilatory as well as expensive. On several occasions the states-general, and even the parliament itself, petitioned for the increase of the judges' salaries, in order that the *épices* might be abolished or at least diminished. But the French treasury was never in a condition to adopt this very simple remedy, and the abuse of *épices* lasted till the constituent assembly abolished the old parliaments, and made justice gratuitous.

[Adam Smith, *Wealth of Nations*, bk. v. ch. ii. pt. 2.] R. L.

EQUALISATION OF INTERNATIONAL DEMAND. The equation of international demand is a particular case "of the more general

law of VALUE (*q.v.*) . . . called the equation of supply and demand," but presents some peculiarities which almost justify Mill (*Principles of Political Economy*, bk. iii. ch. 18, § 4), in describing it as "an *extension*" of that law. These are: the absence of (1) a single market—which allows the substitution of price for value in discussing domestic trade, and (2) of the regulator given by cost of production (see INTERNATIONAL TRADE). An analysis of the forces tending to bring about equilibrium of supply and demand, always important, is here essential.

On the simplest supposition—that of two countries trading in two commodities—each article is necessarily the price of the other, and the equation of reciprocal demand is the evident outcome of the bargaining on each side, carried to the point at which no additional advantage can be gained. When several commodities enter into foreign trade the equation is established in substantially the same way. Values are so arranged that the sum of exports is *equivalent* to that of imports, since, were it otherwise, readjustment of quantities, of values, or of both, would be necessary. In the actual complications of foreign trade carried on between many countries the law takes a somewhat different form. "It may be concisely stated as follows. The produce of a country exchanges for the produce of other countries at such values as are required, in order that the whole of her exports may exactly pay for the whole of her imports" (Mill, *Principles*, bk. iii. ch. 18, § 4). Though each country must export to an amount equal to what it imports, its trade with any one country may mainly or even exclusively be import or export, an excess on either side being compensated by a corresponding deficit in the trade with other countries.

The statement of the equation of international demand has to be further modified so as to include the effect of the various elements of *indebtedness*. All debts due to a country act like an effectual demand created by the same value of exports. The principal heads are: (1) interest on foreign loans or on capital invested abroad; (2) freightage for shipping services; (3) such items as (*a*) tribute due by foreign states; (*b*) earnings of citizens abroad; (*c*) expenditure of foreigners travelling in the country. Accordingly, the final result is that "the state of international demand which results in commercial equilibrium is realised when the reciprocal demand of trading countries produces such a relation of imports and exports amongst them as enables each country, by means of her exports, to discharge all her foreign liabilities" (Cairnes, *Leading Principles*, bk. iii. ch. 18, § 5). In the most complicated as in the simplest case, the force producing equilibrium is the action of self-interest, causing the supply of commodities for exchange at such terms as will afford the maximum advantage to the trading countries (see Giffen, *Essays in Finance*).

The mechanism of PRICE (*q.v.*) enables the complex adjustments of value which are requisite to be easily carried out (see INTERNATIONAL TRADE).

As to the difficult question whether the equation of international demand can be consciously altered to the advantage of one of the parties, see Mill, *Principles*, v. ch. iv. § 6; Cournot, *Principes Mathématiques de la Théorie des Richesses; Théorie des Richesses*, bk. iii. ch. iv.; Sidgwick, bk. iii. ch. v., who maintain that it can; also Torrens, the *Budget*. See *contra*, Jevons, *Theory*, pp. 157, 158.

EQUALITY. The claim for equality may mean in politics (1) simply a claim for just and impartial administration of the laws; or (2) a claim that the laws themselves should not favour one class, still less one individual, at the expense of another; or (3) a claim for equal division of the comforts and discomforts of life. In the economic as distinguished from political doctrine, the claim of equality appears as the basis of the theory of free competition, and takes a form not precisely identical with any one of the three described. Economic reasoning, so far as it is quantitative, must assume a similarity of units. There might be a "free competition" within certain classes of the community only; and thus only the first kind of equality might be secured. An economic theory of the probable effects of such a competition would be perfectly possible. The most striking modern instance is perhaps the industrial system of the southern states of America before the emancipation of the slaves. Where the laws were clearly defined and fairly carried out, the task of the deductive economist would be comparatively easy. He would need indeed to postulate that they were so, before he could draw his theoretical conclusions; and he would then be postulating equality in the first sense, impartial administration. There might also be a state of things in which legislation was professedly indifferent to the privileges of particular classes, and all men were left free so far as legal hindrances were concerned, to seek their fortunes in the same ways. Economic theory would assume in this case that there was equality not only in the first sense, but in the second; and this has been perhaps the commonest assumption of modern economists. It was made by Adam Smith with full consciousness of its utopian character; indeed he could not conceive the possibility of so close an approach to it as has now been made by free-trading England. The full attainment of it is, however, impossible in a community of human beings, so long as they are divided by physical, social, and other

causes, into classes respectively weaker and stronger. The effort of legislation has been to redress such inequality by means of special protection and assistance. The result, though for every other reason desirable, is unfavourable to economic theory, so far as it makes the assumption of legal equality, in the second as well as the first sense, farther removed from the reality. It is no doubt possible to conceive the patronage of the laws as simply an attempt to secure to every one that equality of *opportunities*, of which the reinforcement by the laws of the inequalities of wealth would deprive the poorer members of society. From this point of view an economic theory of free competition could be worked out for competing citizens, supposed equally strong and fit for the race for wealth. But the inequalities left out seem too great for the equality assumed. Even if we neglected other causes of difference, opportunities would never be perfectly equal till human beings were physically and intellectually identical one with another.

On the other hand the effort after an equality of opportunities seems to carry society a step nearer perfection than the effort after justice and legal equality in the senses described. The opportunities may be conceived to be not of making money but of developing the faculties and doing the best work for which a man has the capacities. In all the noblest of the founders of socialistic and communistic schemes, such as aimed at equality in the distribution of wealth, equality of opportunities for the development of human individuality has been the real aim, more or less clearly understood. [See also ARISTOCRACY, COMMUNISM, TAXATION (equality of burdens).]

[Sir Jas. Fitzjames Stephen, *Liberty, Equality, Fraternity*, ch. v. "Equality" (1873).—Bédollière (Émile), in Maurice Block's *Dictionnaire de la politique*, art. "Égalité."—A. Wagner, *Lehrbuch; Grundlegung* (1879), 2nd part, §§ 220 to 223, pp. 418-426.—F. Y. Edgeworth, *Mathematical Psychics* (1881), pp. 129, *seq.*—J. S. Mackenzie, *Social Philosophy* (1890), pp. 249, *seq.*] J. B.

EQUATION OF SUPPLY AND DEMAND. (See DEMAND.)

EQUILIBRIUM is discerned by Jevons (*Theory of Political Economy*, ch. iv.) to be a cardinal conception in the abstract science which he elsewhere calls the MECHANICS OF INDUSTRY (*q.v.*). So Professor Marshall, indicating in the preface to his *Principles of Economics* the leading ideas by which he was inspired, says, "the demand for a thing is a continuous function, of which the 'marginal' increment is in stable equilibrium balanced against the corresponding increment of its cost of production." Professor Marshall employs the term *equilibrium amount* as the amount of any commodity produced in a unit of time when the demand for and supply of that commodity are in equilibrium, and when there is therefore no tendency in the quantity produced in a particular time to increase or diminish. The term equilibrium price is similarly used to denote the price of the equilibrium amount in the same circumstances. M. G. D.

EQUITABLE ASSETS. Assets that could be made available for the payment of debts only through a decree or order of a court of equity. Such assets were always treated as a trust fund, and were therefore divided amongst creditors *pari passu* without any regard to the priority of one debt over another. The chief equitable assets are the proceeds arising from the sale of lands devised in trust to pay or charged with the payment of debts.

[Williams on *Executors and Administrators*, pt. iv. bk. i. ch. i., London, 1879.—*The Administration of Assets*, by A. S. Eddis, London, 1880.] J. E. C. M.

EQUITABLE ESTATE. An estate in land that formerly was recognised in a court of equity only. The principal equitable estates are the estate taken by a person entitled to the benefit of land given in trust, equities of redemption (see EQUITY OF REDEMPTION), and equitable charges.

[*Principles of Equity*, by E. H. T. Snell, London, 1892.] J. E. C. M.

EQUITABLE EXECUTION. The method by which a judgment creditor obtains payment by the appointment of a receiver of the rents and profits of the lands of the debtor. At common law certain forms of property, such as the interest of a mortgagor in the mortgaged premises, or the right to an unascertained sum of money, could not be reached by any ordinary writ. When the creditor had exhausted every method of obtaining payment he could resort to the Court of Chancery, who would appoint a receiver. Now the High Court of Justice can appoint a receiver in all cases where it is just and convenient that such appointment should be made.

[*The Law of Execution*, by T. K. Anderson, London, 1889.] J. E. C. M.

EQUITABLE MORTGAGE. A contract for a mortgage that previous to the Judicature Acts could be enforced only in a court of equity. The most usual case in which it arises is where a person deposits the title deeds of property with a creditor as security for a debt. But a mortgage is also "equitable" if the subject matter is trust or equitable property, such as an equity of redemption, or where there is a written agreement to make a mortgage. The mortgagee in every case may either call on the mortgagor to make a legal mortgage or may take proceedings to enforce a foreclosure or a sale.

[*The Principles of Equity*, by E. H. T. Snell, London, 1892.] J. E. C. M.

EQUITABLE WASTE. Waste in the nature of acts of spoliation, that a court will restrain a tenant for life from committing, though his estate was granted to him with liberty to commit waste, such as pulling down the family mansion or cutting down ornamental timber.

[Goodeve, *Law of Real Property*, London, 1891.] J. E. C. M.

EQUITY is the name applied to a number of legal rules, which formerly were administered by the court of chancery. The chancellor was originally the king's secretary, and as such he had to advise the king in "matters of grace and favour"; viz. in matters in which the king's intercession was invoked for the sake of mitigating the strict rules of the common law. "When early in the reign of Edward III. the chancellor ceased to be a part of the king's personal retinue, and to follow the court, his tribunal acquired a more distinct and substantive character . . . ; petitions for grace and favour began to be addressed primarily to him, instead of being simply referred to him by the king, or passed on through his hands. In the twenty-second year of that king such transactions were recognised as the proper province of the chancellor, and from that time his separate and independent equitable jurisdiction began to grow into the possession of that powerful and complicated machinery which belongs to later history" (Stubbs's *Const. History*, ii. 269). One of the most important stages in that growth was reached when, in the reign of Richard II., the "writ of subpœna" was introduced, which enabled the chancellor to enforce obedience to his decrees by the threat of imprisonment. One of the most important matters which came under the chancellor's jurisdiction was the protection of the rights of persons possessed of "uses" in land. For several reasons it had become convenient to sever the legal ownership of land from the beneficial ownership, and with that object it became customary on a transfer of ownership to enfeoff one person "to the use" of another. The first-named person was called the "feoffee to the use," and he was the only person whom the ordinary courts recognised; but as he was in duty and conscience bound to allow the rights of beneficial ownership to the second-named person, known by the technical name of "cestui que use," the chancellor in the exercise of his equitable jurisdiction compelled him to do so, if he wished to take advantage of his formal right. The practice in matters of this nature developed into a regular system called "equity," to distinguish it from the "common law" administered by the other courts. That system was characterised—(1) by the recognition of rights which the other courts refused to enforce (so-called "equitable rights"); (2) by legal doctrines differing in substance from the doctrines of common law; (3) by a special procedure; (4) by special kinds of relief.

(1) The most conspicuous among equitable rights are the rights derived from trusts. Trusts are the modern successors of "uses," but are used on a much larger scale, and also in the case of personal property; the most familiar instances being the trusts created by wills and settlements, by which the control of certain land or certain funds is given to one or more persons for the benefit of another person or other persons. Another instance of an equitable right is the right of the mortgagor to redeem the mortgaged property, the legal right to which is vested in the mortgagee.

(2) Amongst doctrines specially belonging to the sphere of equity may be mentioned the rule that a debt may be assigned; that, in the absence of an express stipulation or necessary implication, time is not considered as of the essence of a contract, that penalties named in contracts cannot be enforced unless they partake of the nature of liquidated damages, etc.

(3) The administration of trusts and of the estates of deceased persons involves protracted inquiries and the taking of accounts, etc.; for this purpose a special procedure and a special machinery has been developed in the courts of equity, which were the only courts which had to deal with matters of this nature.

(4) Among the special kinds of relief which could be obtained with the assistance of the courts of equity, the right to claim specific performance of contracts for the sale of land, and the right to claim injunctions, *i.e.* orders restraining the opposite party from doing certain acts injuring the rights of the plaintiff, are the most important. The courts of equity, in granting relief of this kind, were supplying a material defect in the administration of justice, as in the courts of common law; the only remedy in the case of breach of contract or injurious acts consisted in pecuniary damages, which in many cases did not adequately compensate the injured party. The power of the courts of equity to enforce their decrees by the imprisonment of disobedient parties materially helped them in the exercise of this jurisdiction.

The Judicature Act of 1873 has merged the equity courts and the courts of common law into one high court, and the rules of equity are now administered in all courts; but as they are derived from a different source from the common law rules, and have always been treated as a separate system, the distinction is still kept up, though it has no longer any practical meaning. The matters which are specially fitted for the procedure of the chancery court, have, however, been assigned to a special chancery division which is organised in a manner appropriate to the proceedings required with regard to them.

[Spence, *Equitable Jurisdiction.*—H. A. Smith,

Principles of Equity. For the place of equity in systems of law generally, and its importance in the evolution of society, see Maine, *Ancient Law*.] E. S.

EQUITY OF REDEMPTION. The right that a mortgagor has to recover, on payment of principal, interest, and costs, a mortgaged estate which has under the mortgage deed become the property of the mortgagee owing to the failure of the mortgagor to pay the principal and interest at the time agreed on. The right resembles real estate inasmuch as it will descend to the mortgagor's heirs. It is alienable, and may itself be mortgaged.

[*The Principles of Equity*, by E. H. T. Snell, London, 1892.] J. E. C. M.

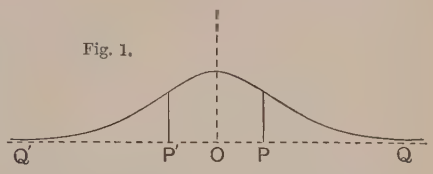
EQUITY TO A SETTLEMENT. When a husband had to resort to a court of equity in order to reduce into possession property of his wife, the court compelled him to make a settlement of a portion, usually one half, of such property on the wife and children.

[*The Principles of Equity*, by E. H. T. Snell, London, 1892.] J. E. C. M.

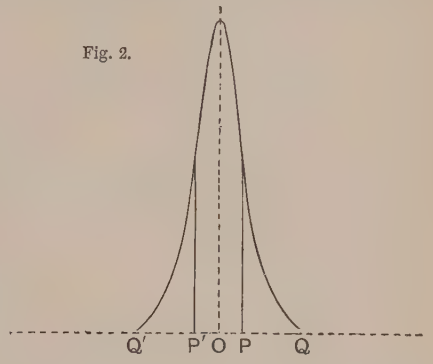
ERROR EXCEPTED. These words are frequently inserted at the end of a statement of account, and are intended to show that the accounting party wishes to reserve the right to make further claims in case any error should subsequently be discovered in the account.

E. S.

ERROR, Law of.* When an average of a set of statistics is taken, the deviation of any one of them from the average is sometimes called an *error;* and the arrangement of the group about its mean, a *law of error*. A particular arrangement, which under certain frequently-realised conditions arises, is designated as *the* law of error. According to this law the figure which is likely to occur most frequently is the one which forms the average; the others are grouped symmetrically above and below the average; becoming less frequent as they are more distant from that central magnitude. In the exact language of symbols, if x_1, x_2, etc., are the quantities averaged, and X the average, the number of quantities comprised between x and a neighbouring value $x+\Delta x$ is approximately $= n\,\Delta x\,\frac{1}{\sqrt{\pi}c}e^{\frac{(X-x)^2}{c^2}}$; where π and e are the well-known constants 3·1415 . . ., 2·718 . . .; and c is a constant proper to the group under consideration. This arrangement is represented by the curve $Y=\frac{n}{\sqrt{\pi}c}e^{-\frac{(X-x)^2}{c^2}}$; the number of observations in the neighbourhood of any point in the axis of x being proportioned to the ordinate at that point; and the number of observations comprised between two values of x being equal to the area intercepted by the ordinates at those two points, the curve, and the axis x. Two illustrations of this curve are given in the annexed diagrams. The curve is spread out, as in Fig. 1, when the constant c is



large; it is gathered in, as in Fig. 2, when the



constant c is small. The constant c being ascertained for any group of statistics, we are able to predict what proportion of the group will probably be comprised between limits defined in terms of that constant. Thus half of the group is likely to be comprised between the limits $X-\cdot4769\ldots c$ and $X+\cdot4769\ldots c$; or, in other words, it is as likely as not that an observation taken at random will be distant from the average X by an interval greater than $\cdot4769\ldots c$; which multiple of c is accordingly called the *probable error*. Again the greater part of the group is comprised between the limits $X-2c$, $X+2c$; the odds are more than 200 to 1 against any observation being at a distance greater than $2c$ from the average. The odds are 50,000 to 1 against the distance of any observation from the average being greater than $3c$. The points P and Q (P′ and Q′) in the figures are intended to represent the "probable" and what may be called the *improbable error* ($2c$ or more).

The condition under which the law of error is fulfilled is that each of the things averaged is dependent in the same way upon (the same function of) a great number of independently variable elements. For example add together ten or more digits obtained thus: the first is the *first* decimal place in any constant, *e.g.* π, the second addendum is the first digit in any other constant, *e.g.* e, and the remaining eight constituents of the sum are the *first* digits in almost any other unconnected constants. Form another

sum of ten digits by taking the *second* decimal place in each of the ten constants; and so on. The set of sums thus formed will group themselves according to the law of error; the average being 45, and the constant c being $\sqrt{165}=13$ nearly. About half the group will be found between $45-6$ (*i.e.* 39) and $45+6$ (*i.e.* 51) since $\cdot 477\sqrt{165}=6$ nearly. A very small proportion of the group—less than a two-hundredth part—may be expected to occur outside the limits 45 ± 26. ($26=2\times\sqrt{165}$ nearly). If the number of elements entering into each of the figures averaged had been greater than ten, *e.g.* twenty, the "probable" and the "improbable" error would have been greater *absolutely*, namely 10 and 36 respectively; but less *relatively* to the average, now 90. Similar consequences would follow if, instead of a simple *sum*, we had employed almost *any function*.

There is reason to believe that the condition which has been indicated is frequently fulfilled; and the law of error has been observed to prevail in extensive classes of phenomena, which may thus be summarised:—

1. Repeated observations of one and the same physical quantity.

2. Shots fired at the same object.

3. A series of numbers each of which is obtained by taking at random a batch of say n balls out of a bag containing white and black balls mixed up in a certain proportion, and noting the number of whites in each batch of n balls; or a series obtained by tossing coins or dies and noting the number of heads or aces; and similar series.

4. Measurements of the organs of numerous specimens of a natural species.

5. Statistics of social phenomena which do not present a *progressive* character, *e.g.* the number of births, deaths, or marriages or the *rates* of the same, or the ratios between the male and female rates; observed at places or times not materially distant from each other.

Illustrations of the third and fifth classes are given in the accompanying tables, the materials of which have been taken from Professor Westergaard's *Theorie der Statistik*. In Table I., column 1, was obtained from 100 batches of balls; each batch numbering 100 balls, which were taken at random from a bag containing black and white balls in equal proportions; the number of white balls in each batch having been noted, the number of these numbers comprised between two limits, which are defined by a multiple of the constant c, forms an entry in column 2. The corresponding limits are given in column 1. Thus twenty-five of the observations occurred between the limits $50-\cdot 3\frac{c}{\sqrt{2}}$ and $50+\cdot 3\frac{c}{\sqrt{2}}$, or 47 and 53, since the value of c is here $\sqrt{2}\times 10$; 40 of the errors occurred between $50-\cdot 5\frac{c}{\sqrt{2}}$ and $50+\cdot 5\frac{c}{\sqrt{2}}$, or 45 and 55; and so on. Column 3 similarly registers the arrangement of the statistics obtained from 750 batches of lottery tickets—each batch numbering 100—by noting the number of prizes in each batch (the average being 16, and the constant c being 5 nearly).

Table I.

Table showing the correspondence between fact and theory in the arrangement of the numbers of white balls in batches of 100 balls each drawn at random from a bag; and of prizes in batches of 100 tickets drawn at a lottery.[1]

Limits above and below the average.	Percentage of errors within limits.		
	Observed.		Calculated.
	Balls drawn from bag.	Tickets drawn at lottery.	
1	2	3	4
$\cdot 3\frac{c}{\sqrt{2}}$	25	23	*23*
·5 ,,	40	36	*36*
·7 ,,	50	48	*49*
1·1 ,,	70	67	*69*
1·5 ,,	85	83	*82*
2·1 ,,	95	95	*93*

These results of observation are to be compared with the predictions of theory which are contained in column 4.

Table II.

Table showing the correspondence between fact and theory in the proportion of male to all births for nineteen years in Italy.[2]

Limits above and below the average.	Number of errors within limits.	
	Observed.	Calculated.
1	2	3
$\cdot 3\frac{c}{\sqrt{2}}$	2	*5*
·5 ,,	7	*7*
·7 ,,	9	*9*
1·1 ,,	12	*12*
1·5 ,,	16	*14*
2·1 ,,	17	*16*

[1] Westergaard, *op. cit.* p. 67.

[2] See Westergaard, *op. cit.* p. 39. The first column differs from his only in notation; the second column is the same as his; the third column is calculated from the second column of his table at p. 67.

In Table II., the first column gives limits defined by the constant c as before; the second column gives the arrangement of errors obtained by comparing the proportion of male births to all births, male and female, in Italy for each of nineteen years with the average proportion for the whole period; the third column gives the theoretical arrangement.

The applications of the law of error with which we are here concerned relate partly (I.) to practice, and partly (II.) to the investigation of causes.

(I.) It is useful, when employing an average obtained from statistics, *e.g.* a death-rate, or an index-number, to have the means of estimating the extent to which the figure in the case with which we are dealing is likely to differ from the average obtained in past experience. It is useless to calculate the average to a number of decimal places not warranted by the "probable error" to which the figure is liable.

(II.) Under the second head two cases may be distinguished: (*a*) where the analogy of simple games of chance holds good; the constant c being that which would be obtained if the statistics were of the sort which forms our *third* class of phenomena above; and (*b*) where the constant is not such.

(*a*) In the first case we have the advantage of knowing that the given group cannot be broken up into two, or more, with widely different averages; that the analysis which is a principal object of the scientific statistician has been already pushed almost up to its limit. Our statistics cannot be like batches of balls taken from bags in which the proportion of white to black is very different; but rather are analogous to the successive numbers of white balls occurring in batches of the same size taken at random from the same bag. It would appear hopeless therefore to trace by ordinary induction the causation of any particular event of this character. It is only crazy gamblers who pretend to predict the "runs" in games of pure chance. But we are not precluded from applying the law of error to detect delicate differences, such as may exist between a perfect and a slightly-loaded coin. Take for example the observation that the percentage of male compared with female births for more than a million *plural* births (of twins or triplets) in Prussia during a certain period of years was 104·447 (males to 100 females); whereas the corresponding ratio for all births (single as well as plural) was 106·305; the observation on which this average is based numbering several millions. Given these numbers, and knowing as we do that the phenomenon belongs to class (*a*), we are able to determine the constant c; which proves to be nearly ·3. Thus the difference between the two averages compared, viz. 1·858, is about six times the constant, and accordingly (see above par. 1) the odds against the observed difference in the averages being due to accident and not to a real cause which may be expected to continue acting—are many times more than 50,000 to 1 (Duesing). We have obtained, at a stroke, a degree of evidence in favour of a law which otherwise could only be obtained by a laborious analysis of the returns. By parity of reasoning it is found that in times and places where the absolute number of births is large the proportion of males is small (*ibid.*).

(*b*) This summary method may be employed also in the second case (where the analogy with games of chance does not hold good); but not in such a clear light of foreknowledge as to the character of the causes under investigation.

Besides the exact and direct applications of the law of error, it also affords what may be called "regulative ideas" to the statistician; supplying the *rationale* of many received maxims: that *ceteris paribus* an average is more worth the greater the number, and the less the divergence, of the returns averaged; that a few accurate returns may be better than many loose ones.

[For a general exposition, at once simple and accurate, of the law of error, see Venn, *Logic of Chance*, third ed. 1888, chaps. xviii. and xix. See also Jevons, *Principles of Science*, chap. xvii.—Bertillon, art. "Moyenne," *Dictionnaire Encyclopédique des Sciences Médicales*.—Quetelet, *Physique Sociale*. For the conditions under which the fulfilment of the law may be expected, Glaisher, *Memoirs of the Astronomical Society*, vol. xl. p. 104.—Galton, *Philosophical Magazine*, 1875, "Statistics by inter-comparison."—Edgeworth, *ibid.* 1892, "The Law of Error."—For the *a posteriori* proof, that the law is fulfilled, see Galton, *Natural Inheritance*.—Westergaard, *Grundzüge der Theorie der Statistik*, chap. iii.—Edgeworth, "Empirical proof of the law of Error," *Phil. Mag.*, 1887.—For the application of the law to practice, Dormoy, *Théorie mathématique des assurances sur la vie*. For the application of the law to induction, (*a*) where the analogy of games of chance holds good, Westergaard, *op. cit.*—Lexis, *Massenerscheinungen*. — Duesing, *Das Geschlechtsverhältniss in Preussen*; (*b*) in general, Edgeworth, *Journal of the Statistical Society*, Jubilee Volume, 1885, "Methods of Statistics," *ibid.* December 1885, "Methods of Determining Rates." Many of these writers throw light on other parts of the subject besides those with special reference to which they have been cited. Several other authors might have been cited. Merriman has published an immense list of writers on the cognate subject of the *Method of Least Squares*, many of whom have touched on the *law of error*, and some on its applications to social phenomena (see PROBABILITIES; STATISTICS).] F. Y. E.

ESCHEAT (historical) was a feudal term introduced by the Normans into England, and applied to the reversion of land to the lord. The ordinary cause of such reversion was the failure of heirs, when the whole estate passed into the hands of the lord. If the heir was a

minor, the phrase was *escœta cum hœrede*, when the necessities of the heir and other children were paid for out of the estate and the surplus only went to the lord, until the heir, on reaching his majority, paid a relief and obtained seisin. Escheat also took place in cases of treason or felony. If the criminal was a tenant-in-chief, the whole of his property reverted to the crown; but if he was a sub-tenant, his movables only fell to the crown, while the real estate passed to the immediate lord.

[*Dialogus de Scaccario*, ii. x.] R. L.

ESCHEAT (MODERN LAW), takes place where a person dies intestate and without an heir. The lands of such a person go to the feudal lord, but, as in the case of freehold land the right of mesne lords can in our days be established but rarely, such land generally goes to the sovereign as lord paramount. Copyhold land goes to the lord of the manor, and § 4 of the Copyhold Act provides that the right of escheat is to continue after enfranchisement; enfranchised copyhold land, though otherwise of the nature of freehold land, does not therefore escheat to the crown, but goes to a private person. Formerly the lands of felons were subject to the right of escheat, but an act passed in 1870 has repealed this rule. On the other hand the Intestate Estates Act of 1884 has made certain rights as to real property subject to escheat, which were not so subject before. The same act has enabled the crown to waive its right in certain cases. The procedure which takes place to inquire as to the right of the crown has been simplified by the Escheat (Procedure) Act of 1887.

The right of the state to acquire the property of a person dying without relations or a will exists in most countries independently of feudal rules, and seems justified by reason and convenience.

[Bentham, J. S. Mill, Godin, and other reformers, have proposed to narrow the rights of intestate succession (*i.e.* to extend escheat) in order to correct, to some extent, the unequal distribution of wealth.] E. S.

ESCUDO. The name of the Spanish half dollar.

Gold and Silver Coins as follows:

Metal.	Denomination of Coin.	Fineness.	Weight.	Value.	
				In gold 916·6 fine at £3:17:10½ an ounce.	In gold francs, 900 fine.
			grains.	£ s. d.	francs.

	4 Escudos	900	51·78	0 8 3	10·4
	2 Escudos (or Dollar)	900	25·89	0 4 1½	5·2

Metal.	Denomination of Coin.	Fineness.	Weight.	Value.	
				In silver 925 fine at 5/6 an oz.	In silver francs, 900 fine.
			grains.	s. d.	francs.
Silver	Escudo (or ½ Duro or Dollar)	900	200·30	2 2¾	2·6

These coins have not been struck for circulation in Spain since 1868, when the system of pesetas (francs) was introduced. Similar coins, including a doubloon of eight escudos, are current in the Philippine Islands (see DOUBLOON). F. E. A.

ESCUSADO, the name of the portion of ecclesiastical tithes made over in 1567 by the Pope to the crown of Spain. E. Ca.

ESSART, EXART, sometimes also called ASSART. A mediæval term applied to a portion of forest land cleared and brought into cultivation. To make essarts was technically a breach of the forest law, punishable by fine. These fines, with the yearly rents levied on the essarted lands, which the maker of the essart was usually allowed to keep under cultivation, formed a considerable item in the revenues of the royal and other lords of forests in mediæval England. These rents would appear to have been fixed at the highest rate that could be maintained, a rate which will be found to be often several times as great as that paid by free or even customary tenants for other land in the same neighbourhood. In spite of these high rates, however, fresh essarts were made almost every year in England. The forest of Wirrall in Cheshire, for instance, was entirely under cultivation before the death of the Black Prince, who, in his capacity of Earl of Chester, by a formal charter of disafforestment, put his seal to the work of reclamation. The word *essart* has been variously derived from the old French *assortir*, to make smooth, or one of the low Latin terms, *exertum*, rooted up, *sarrire*, to weed, or *exarare*, to plough up.

[Manwood, *Forest Law*, London, 1596, etc.—Ducange, *Glossarium Mediæ et Infimæ Latinitatis*, ed. nova a L. Favre, Paris, 1884.—Forest accounts among the ancient records of the exchequer in the Public Record Office.] A. H.

ESTATE. A so-called owner of land has, according to English law, no absolute right of ownership; all that he has is an interest varying in extent and duration, and known in technical language as an "estate" in the land. The largest estate known to the law is an "estate in fee" (fee simple), which gives the owner as complete rights of enjoyment and alienation as the nature of the property will admit; an estate tail (see ENTAIL), being convertible into an estate in fee—by the tenant alone, if in

possession, and otherwise by him jointly with the tenant for life—confers rights nearly as complete. An estate for the life of the tenant, or for the life or lives of another person or other persons, gives the tenant the privileges of ownership during his life or during the life or lives of such other person or persons; but a tenant for life—unless the estate is conferred upon him "without impeachment of waste"—is not allowed to pull down buildings, cut timber, or open mines. An estate for the life of another person is called an "estate pur autre vie." Estates in fee or in tail, and estates for life, are called "freehold" estates, estates for a definite number of years, however large the number may be, are "leasehold," also called "less than freehold" (see LEASEHOLD PROPERTY). The word estate is also used as a comprehensive name for the assets of a bankrupt or of a deceased person. In the latter case a distinction is made between freehold land and houses (real estate) and other property (personal estate). E. S.

ESTATE DUTY. See DEATH DUTIES.

ESTCOURT, THOMAS (end of 18th and early 19th century). Thomas Estcourt sat in parliament as member for Cricklade from 1784 to 1806. In 1804 he published *An account of an Effort to Better the Condition of the Poor in a Country Village* (*Long Newton*) *and some Regulations suggested by which the same might be extended to other parishes of a similar description.* The work was printed by the board of agriculture. Estcourt states that in 1800 arrangements were made for letting to any cottager a small quantity of land at a rent of £1 : 12s. an acre, the land to be forfeited if not properly cultivated, or on the receipt of parish relief other than medical. He states that the offer was largely accepted, and that the scheme greatly decreased the poor-rate in the village. C. G. C.

ESTERNO, PHIL., COMTE D' (1805-1883), born at Dijon, died at Paris. Esterno's life was mainly devoted to agriculture and to political economy. The first work of his which caused him to be known as an economist was entitled, *Des banques départementales en France*, 1 vol. in 8vo, 1838. In this Esterno argued in favour of departmental banks, to be established in a good many towns, and at Dijon in particular. This was at a time when the government, urged on by a spirit of centralisation, were hostile to institutions of this description

In 1840 Esterno took part in a discussion instituted by the Academy of Moral and Political Sciences, on the signs and causes of poverty in different countries. BURET (*q.v.*) won the prize. Esterno's paper was rejected because, according to the report, "it was not an economic essay which was wanted." This work, printed in 1842, under the title of *La misère; de ses causes, de ses effets*, in 8vo, reflected the ideas of Malthus, while Buret, on the other hand, had allowed sentiment to overpower reason.

During the same year (1842) Esterno assisted as secretary, in conjunction with P. Rossi, who was president, in founding at Paris a society for promoting political economy (*Société d'économie politique*), an association which only lasted a few months, but was a forerunner of the society now known under the same name.

In 1867-68 Esterno published another work, *Des privilégiés de l'ancien régime en France et des privilégiés du nouveau*, 2 vols. in 8vo. In this work the author argued, in a brisk and original style, in favour of agriculture, which was put too much on one side by the privileged persons under the new regime, the moneyed classes, as distinguished from the landed proprietors, notwithstanding the untrustworthy titles of some of their institutions, *Le Crédit agricole*, for example. Before this date (1867-1868), and later on, Esterno strove, on behalf of the agricultural interest, against those artificial monopolies which, even to this day, have arrested the development of agriculture in France. He thus became deeply interested in works of irrigation, and it is to him and to his energy, though he never allowed his name to appear, that the adoption of the regulations of 29th April 1845 and 11th July 1847 (*lois d'Angeville*) is due.

Esterno's mental activity led him to occupy himself with other subjects with which we are not concerned here. His intelligence, his energy, and his scientific devotion enabled him to render them interesting to others. He was a vice-president of the second *Société d'économie politique.* A. C. f.

ESTIMO. The revenue of Florence in the flourishing days of the republic was mainly derived from indirect taxes, which produced some 300,000 florins a year. But in times of war, which became frequent in the 14th century, this income was insufficient, and it was supplemented either by direct taxes or by compulsory loans (*prestanze*). Both taxes and loans were supposed to be based upon an *estimo*, or government valuation of property, and hence the term *estimo* comes to be applied to the exactions themselves. The earliest *estimo* was formed in 1288, and seems to have referred only to real property. Another assessment took place in 1327, when a foreign judge was appointed to determine the wealth of each individual by the secret testimony of seven of his neighbours. But the attempt to provide a regular basis for direct taxation proved a failure in the 14th century. An *estimo* soon became obsolete as property rapidly changed hands, and a charge upon real property alone pressed heavily upon the noble families and the peasants of the country, while the wealthy burghers escaped

For the most part the forced loans were arbitrarily assessed by the existing government, and one great reason for the Florentine greed for office, which introduced the system of lot, was the desire to escape taxation. When the CIOMPI (*q.v.*) rose in revolt in 1378, one of their demands was that no loan should be levied without an *estimo*, but their subsequent defeat prevented any change being made. The discontent excited by arbitrary and unfair assessment forced the government in 1427 to introduce the CATASTO (*q.v.*), which was only a new name for a thorough *estimo* of real and personal property including income. But this great reform was abandoned by Cosimo de Medici in 1441, when the old arbitrary assessments, formerly maintained to favour the wealthy burghers, were revived to relieve and conciliate the poorer classes. The Medici from this time introduced the principle of progressive taxation, and, as Guicciardini says, used the taxes instead of the dagger to ruin their opponents.

[Canestrini, *La Scienza e l'Arte di Stato desunta dagli Atti officiali della Repubblica Fiorentina e dei Medici* (only one volume of this great work was published).—Napier, *Florentine History*, vol. iii. p. 117.—Perrens, *Histoire de Florence.*] R. L.

ESTOPPEL. A term used in connection with the rule of law, according to which a person who, by statements or conduct, causes another person to believe in the truth of a certain matter of fact, with the intention of inducing him to act upon it, cannot, in any dispute concerning the matter in question, be allowed to assert that the state of things which he represented to be in existence, did not, in fact, exist; thus, for instance, a person, by accepting a bill of exchange, induces the holders to assume that the drawer was of full age, and otherwise capable to draw a bill, and he is therefore "estopped" from denying the drawer's capacity (Bill of Exchange Act, § 54 [2]). Estoppel by conduct is in certain cases also called "estoppel by negligence," *e.g.* if a person by the careless filling in of a cheque enables a fraudulent holder to alter the amount, he is estopped from denying that he drew the cheque for the full amount, as by his negligence he has allowed the banker to think that he has done so. Estoppel by statement or conduct is in the older law books called "estoppel by matter in pais," and distinguished from "estoppel by deed" and "estoppel by record." "Estoppel by deed" prevents a party to a deed from denying any fact mentioned in the same by way of recital or otherwise. "Estoppel by record" precludes a party to an action, or his successor in title, from denying any fact established by the decision in the action. The fullest statement on the law of estoppel is contained in the notes to the Duchess of Kingston's case in Smith's *Leading Cases*, vol. ii. E. S.

ESTOVERS (derived from the same root as the old French word *estovoir* = to be necessary), also called "Bote," is the right of a tenant for life, unless restrained by agreement, to take the necessary wood from the estate for the use or furniture of a house or farm. "Common of Estovers" is the right of a commoner to cut wood (see COMMONS). E. S.

ÉTATS GÉNÉRAUX, THE, or States General of France, were, under the old monarchy, the national representative assembly of the kingdom, composed of elected members of the three orders, the noblesse, the clergy, and the third order or state (*Tiers État* or *bourgeoisie*), but no fixed rule was ever followed for their election and assembling. Their first authentic meeting was summoned, 1302, by King Philippe le Bel, to assist him in his struggle against Pope Bonifacius VIII.; after this date they were convoked at irregular and often very protracted intervals, whenever the royal finances were in a state of extreme distress. In 1357, during the captivity of King John in England, they vainly tried to give a constitution to the kingdom. The *Etats Généraux*, which must not be confounded with the *Assemblées des Notables*, were at all times steady and consistent upholders of the theory that no tax could be valid without their assent; the monarchy never contested this doctrine, but never followed it in practice. The *États Généraux* of 1614 were the last before the revolution of 1789.

[Toussaint Quinet, *Recueil des États tenus en France*, 1651, 1 vol.—Paulin, *Grandes chroniques de France* (vol. vi. 1350-1382, Paris, 1838).—Jean Masselin, *Journal des États Généraux de 1484* (in Latin, translated into French by Bernier in 1835).—Rathery, *Histoire des États Généraux en France* (1845).—Bouillée, *Histoire complète des États Généraux et autres assemblées représentatives de 1302 à 1626* (Paris, 1845, 2 vols.).—Augustin Thierry, *Histoire du Tiers État.*—The most recent works are M. Jallifier's *Histoire des États Généraux* (1 vol. Paris, 1888), and M. Georges Picot's exhaustive *Histoire des États Généraux considérés au point de vue de leur influence sur le gouvernement de la France* (1355-1614).] E. Ca.

ETHEL. See ALOD.

EVANS, DAVID MORIER (1819-1874), was born in Wales. He treated economic subjects from a journalistic point of view, aiming rather at giving an accurate narrative of the successive phases of economic crises and the like than at tracing their hidden causes. In his own words he was a man of "facts and figures."

Besides numerous contributions to the *Bankers' Magazine*, which he edited for some years, the *Bullionist*, and the *Stock Exchange Gazette*, Evans wrote *The Commercial Crisis, 1847-48*, London, 1848-49.—*The Annual Commercial Register*, London, 1850.—*Fortune's Epitome of the Public Funds*, London, 1851-56.—*Facts, Failures, and Frauds*, London, 1859.—*The History of the Commercial Crisis, 1857-58, and of the Stock Exchange*

Panic, 1859, London, 1859.—*Notes on Speculation*, London, 1864.

[See *Dictionary of National Biography*, London, 1888, *Times* for 2nd January 1874.] A. H.

EVANS, Thomas (end of 18th and early 19th century). In 1798 Thomas Evans was acting as secretary to the London Corresponding Society, and was imprisoned for nearly three years on a charge of treasonable practices. He afterwards acted as librarian to the Spencean Society, and published the work whose title is given below. The book contains the usual Spencean doctrines, advocates the nationalisation of the land as the only remedy for the prevailing distress, and denounces Malthus as the "hireling of pagan landlords."

Christian Policy, the Salvation of this Empire, "being a clear and concise examination into the causes that have produced the impending national bankruptcy, and the effects that must ensue unless averted by the adoption of the only real and desirable remedy" (2nd ed., 1816).

C. G. C.

EVELYN, John, F.R.S. (1620-1706), the author of the famous *Diary*, published several works of economic interest. Amongst these may be mentioned (1) *Sylva, or a Discourse of Forest Trees and the Propagation of Timber*, etc., London, 1664, fol., 5th ed. 1729. A new edition with notes by A. Hunter was published in 1776; 4th ed. 1812. (2) *Navigation and Commerce, their Origin and Progress. Containing a Succinct Account of Trafficke in General: its Benefits*, etc., London, 1674, 8vo. (3) *Terra: A Philosophical Discourse of Earth, Relating to the Culture and Improvement of it for Vegetation, and the Propagation of Plants*, etc., London, 1676. New edition, with notes by A. Hunter, 1778. (4) *Numismata: A Discourse of Medals, Ancient and Modern*, etc., London, 1697, fol. Evelyn also translated several French works on horticulture.

[M'Culloch's *Literature of Pol. Econ.*, 146, 212. For a full account of Evelyn's life and writings see *Dictionary of National Biography*.]

W. A. S. H.

EVELYN, John (*fl.* 1830), of Edgbaston, Birmingham, was the author of *Co-operation: An Address to the Labouring Classes on the Plans to be pursued in Conducting Trading Unions*, 1830, 8vo. By "trading unions" Evelyn meant co-operative societies.

[*Brit. Mus. Cat.*] W. A. S. H.

EVERETT, Alexander Hill (1792-1847), was born at Boston, Massachusetts. He graduated with the highest honours at Harvard; engaged in the diplomatic service, and from 1825 to 1829 served as U.S. minister to Spain; returned to Boston and became editor and proprietor of the *North American Review*; from 1830 to 1835 was in the Massachusetts Legislature; in 1840 undertook a diplomatic mission to Cuba; and in 1847 was engaged in a similar errand in China, when he died at Macao. His writings cover a wide range in history and literature. Of economic interest is the following: *New Ideas on Population with Remarks upon the Theories of Malthus and Godwin*, Boston, 1823, pp. 125 (translated into French). In opposition to the Malthusian theory Everett argues that an increase of population is a cause of abundance and not of scarcity, since it develops the new elements of skill by which the same quantity of labour is applied with greater effect. Although the population of Great Britain doubled in the 18th century, improvements in the mode of applying labour increased its productiveness probably a thousand times. Everett, by travel and intercourse with eminent men in Europe, enjoyed opportunities possessed by few of the earlier American writers on economic subjects. He had an interview with Malthus, carefully discussing the points at issue. The latter suggested to Everett that his views were similar to those of Mr. S. Gray in the *Happiness of States* (1815). The Malthusian theory was also discussed in a correspondence between Everett and Prof. George Tucker in the *Democratic Review*, vol. xvii. pp. 297-310, 379-391, 438-444, and vol. xxi. pp. 397-410.

[For a summary of Everett's views, *v. Dem. Rev.*, vol. x. p. 466, where there is a sketch of his life until 1840. To the *North American Review* he contributed many essays, among them "M'Culloch's Political Economy" (1827), xxv., 112; "Political Economy" (1829), xxviii., 368; "British Opinions on the Protecting System," xxx., 160; "American System," xxxii., 127; "Phillip's Manual of Political Economy," xxxii., 215; "The Laws of Population and Wages," xxxix., 68; "Rae's Political Economy," xl. 122. Everett was a protectionist; and in 1833, as chairman of a committee at the Tariff Convention in New York, prepared a memorial to Congress in reply to the memorial prepared by Gallatin for the Free Trade Convention at Philadelphia. He advocated reforms in the banking system in two articles on "The Currency" in *Boston Quarterly Review*, July 1839; January 1840.] D. R. D.

EVERETT, George (*fl.* 1693-1698), Shipwright, appears to have occupied some position of importance in the government dockyards. He was also employed by the commissioners of customs in the detection of smuggling. He published (1) *The Pathway to Peace and Profit; or, Truth in its Plain Dress*, etc., London, 1694, 8vo. (2) *Encouragement for Seamen and Mariners, in two parts*, etc., London, 1695, 4to. The first of these pamphlets embodies certain proposals, which Everett laid before the lords of the admiralty in February 1694, for securing greater economy and efficiency in the dockyards. If they were adopted he promised an annual saving of £100,000. The second pamphlet was directed against the abuses of the system of impressment for the sea service. His object appears to have been to devise a system which

should at the same time secure a constant supply of sailors for the royal navy and get rid of the expense to the government, and "injury to the subject," of the system then in vogue. Amongst his suggestions may be noticed the registration of all seamen and mariners, fixed pay days, abolition of the sale of all offices in the navy, and a strict application of the principle of promotion by merit, an additional allowance for seamen disabled in the public service, the payment to the family of the sailor of six months' wages for every nine months he should be at sea, etc. Everett's pamphlets are of no theoretical interest, but they throw much light on the conditions of labour in the dockyards and the sea service at the end of the 17th century.

[Watt's *Bibl. Brit.—Cat. of Treasury Papers*, xxxvi. 38; liv. 29.] W. A. S. H.

EVICTION. The recovery of possession of land whether by simple re-entry or by legal process is often termed eviction. Eviction is substantially the same as EJECTMENT. The term is rather popular than technical. F. C. M.

EVOLUTION. See DEVELOPMENT.

EX. ALL. A well-known phrase on the stock exchange, used to signify that a security quoted or dealt in conveys to the buyer no rights in the shape of dividends or drawings or issue of new stock or other contingent advantages. The word ex. is simply short for excluding (see EX. DIVIDEND, EX. DRAWING, EX. NEW). A. E.

EXAMPLES. Examples in economics, as elsewhere, are simply cases, real or fictitious, or partly both, supposed to embody a general principle. They may be classified as follows: (1) *Real but general*, as Ricardo's hunters (*Principles*, ch. i. § i.), and Ad. Smith's bricklayers, carpenters, and men of letters (*Wealth of Nations*, I. x.). The examples are taken from a known genus but not from known individuals. Where the genus is perfectly well known, no cavil is possible. Ad. Smith's illustration of division of labour could hardly have been improved by a reference to a particular pin-making establishment in a specified place. But, in exposition, the more concrete the genus the more telling the example; *e.g.* 'blacksmith' seems nearer life than 'workman.' (2) *Real and particular*, as in Cairnes's illustration of the theory of international trade from the Australian gold discoveries (see CAIRNES). Adam Smith, where he does not use the real and general, uses the real and particular, and falls back on fiction only for his similes (as "the highway," "the waggonway through the air," the "wings," and "the pond and the buckets," *W. of N.*, II. ii.), or his metaphors ("wheel of circulation," "channel of circulation.") Ricardo and his immediate followers have preferred, as a rule, (3) *Fictitious* examples. These may be illustrations of which the component elements are generically well known, as even the favourite "man on the desert island," but the combining of the elements is the work of the writer, and is more or less arbitrary, as De Quincey's "man with the musical box on Lake Superior," and Bastiat's "plank and plane." There is also a risk that the construction of the example may involve a begging of the question to be proved. "Suppose that there are but two nations in the world living side by side, with a population of one million souls in each" (Barbour, *Bimetallism*). "My object was to elucidate principles, and to do this I imagined strong cases that I might show the operation of those principles" (Ricardo, *Letters*). There is no necessary fallacy in this method of exposition any more than in illustrating the law of gravitation by the action of bodies *in vacuo*. Concrete cases must necessarily exemplify much more than one principle, and, even if they suggested a particular generalisation, they may perhaps not clearly illustrate it without a fictitious simplification. The lawfulness of such a method of exposition or, it may be, of proof is discussed elsewhere (see DEDUCTIVE METHOD). J. B.

EXCAMBION is the technical term used in Scotch law to designate the contract whereby one piece of land is exchanged for another. The persons effecting the exchange are known as excambers. Each party gives the other such a warranty of title that, if evicted from the land which he has received, he and his heirs can recover from the other party and his heirs the land which he originally gave. When lands burdened with debt are disponed in excambion, they are freed from that debt and are thenceforward burdened with the debts, if any, formerly affecting the land given in exchange. Tenants in tail have a statutory power of effecting such exchanges which now extends to one-fourth of the total value of the property entailed (see LAND).

[Bell's *Dictionary and Digest of the Law of Scotland*, edited by George Watson, Edinburgh, 1882, art. "Excambion," and the authorities therein cited.] F. C. M.

EXCHANGE.

Exchange, p. 758; Exchange, Value in, 759; Exchange, Value in (History of Theory), p. 762; Exchange, Usury (see Usury), p. 767; Exchange (as Bourse), p. 767; Exchange, Stock, p. 768; Exchange, Provincial Stock, p. 770; Exchange, Foreign, p. 770; Exchange, Foreign (Practical Working of), p. 772; Exchange between Holland and Dutch India, p. 773; Exchange between Great Britain and British India, p. 776; Exchange, Internal, p. 777; Exchange of Notes (Scotland), p. 778; Exchange Broker, p. 778; Exchanger, Royal, p. 778.

EXCHANGE, the voluntary giving of one commodity or service on condition of receiving another, is to a great extent the basis of the existing system of PRODUCTION and DISTRIBUTION (*q.v.*). If there were no exchanges, each article of separate property could be used only by its owner, and, excluding gifts, slaveholding, and

communistic arrangements, each man would have to subsist on what he could produce directly for himself, using his own and no one else's instruments of production. As things are, however, separate property is used in the main by those who are most capable of using it, whether they are its owners or not, and no one lives only on what he has himself produced but each lives on what has been produced by a vast number of other persons (see Adam Smith, *Wealth of Nations*, bk. i. ch. i. at end). This is the result of exchanges; owners of property allow others to use it because they can get commodities and services in exchange for the use of it, and men are able to devote themselves exclusively to one occupation because the products of that occupation can be exchanged for the products of other occupations. While production is thus largely dependent on exchanges, distribution, as the word is commonly understood, could not exist at all without them. The use of the word implies that the whole produce of all the workers is considered to be a joint or common produce which, after being produced, has to be divided or "distributed." If each man lived on his own patch of ground, using his own instruments, and receiving no help from any one either in commodities or services, each man's produce or income would obviously be quite distinct from that of every other person, and the conception of a joint produce requiring to be distributed would never have been formed. Individuals' incomes would vary, but the variations would be questions of production only, since each man's income would depend entirely on the amount he produced. Exchange being practised, questions of "distribution" arise because each man's income depends not only on how much he produces but also on the value of what he has to sell, *i.e.* on how much of certain other things he can get in exchange for a given quantity of his work or of the use of his property.

Adam Smith showed a very fair appreciation of the importance of exchange with regard both to production and distribution. He rightly attributed what he called the "division of labour," but what is now usually called the "division of employments," to the practice of exchange, and he did not treat of wages, profits, and rents, till he had discussed "the rules which men naturally observe in exchanging" goods (*Wealth of Nations*, bk. i. ch. iv.) Unfortunately, James Mill, to whom the common arrangement of English works on political economy is chiefly due, seems to have had no adequate conception of the importance of exchange. He spoke of it as if it were a mere incident which occasionally happens to commodities after they have been produced and distributed (*Elements of Political Economy*, Introduction), and when he endeavoured to improve upon J. B. Say's division of political economy into Production, Distribution, and Consumption, by inserting Exchange, or "Interchange" as he called it, he placed it not only after production, but after distribution also. M'Culloch returned to Say's arrangement, but J. S. Mill followed in his father's footsteps, treating exchange after distribution, and declaring distinctly that "exchange and money make no difference in the law of wages, in the law of rent, nor in the law of profits" (*Principles*, bk. iii. ch. xxvi., Contents). But so far is this from being the case that the very existence of wages, rent, and profits, including interest, is dependent upon exchange. The payment of any particular sum of wages, rent, or profits is a case of exchange, and every variation in wages, rent, and profits is a variation of value, wages being the value of work done, rent the value of the use of land, and profits, the value of the use of capital and of the capitalist's services (see Sidgwick, *Principles of Political Economy*, bk. ii. ch. i. § 2). Of writers since J. S. Mill, most have so far deviated from his arrangement as to place "exchange" before "distribution," *e.g.* Walker, (*Political Economy*), or, with Profs. Sidgwick and Marshall, to treat exchange and distribution as too intimately connected to be treated separately (see DISTRIBUTION). E. C.

EXCHANGE, VALUE IN. Value in exchange, or exchangeable value, denotes a ratio of exchange—"the ratio of the number of units of one commodity to the number of units of another commodity for which it exchanges"; as Jevons particularly clearly points out (*Theory of Political Economy*, ch. iv.), and most authorities admit. The unsettled question is: What are the circumstances which cause the ratio to be what it is? "Utility and difficulty of attainment," answers Mill (bk. iii. ch. ii.), and similar terms are used by almost all economists, but in various shades of meaning, and with different emphasis on each of the two factors. The confusion is aggravated by the not sufficiently noticed circumstance that the operation of the two causes, utility and difficulty, is different in different classes of transactions. It is proposed here to discriminate those essentially distinct cases; mapping out and partially exploring the ground, which may be more fully investigated under the head VALUE.

A convenient tripartite division—Two-sided monopoly, one-sided monopoly (or one-sided competition), two-sided competition—is based upon the degree in which competition is present.

I. The action of competition is at a minimum where the dealers in two articles exchanged are single individuals, or bodies of persons actuated by one will, *e.g.* two governments negotiating a commercial treaty, or a trade-union coming to an agreement with a combination of masters about the rate of wages. The general principle in this case is that both parties will be gainers

by the bargain; in technical language the total utility (see CONSUMER'S RENT, DEMAND, DUPUIT, FINAL UTILITY), of each will be greater after than without the transaction. But to what extent each party will be gainers is not in general determinate; there is a sort of indefinite tract, a "spielraum" (Böhm-Bawerk), within which the point of equilibrium must be determined by other than purely economic considerations. Jevons well says: "the existence of combinations in trade disputes usually reduces them to a single contract bargain of the same [this] indeterminate kind. The men, for instance, ask for 15 per cent advance of wages all round. Rather than have a strike, it might be for the interest of the employers to give the advance, or for the men to withdraw their demand; *a fortiori*, any intermediate arrangement, would still more meet their views. But there may be absolutely no economic principle on which to decide the question. Mathematically speaking, the problem is an indeterminate one and must be decided by importing new conditions" (*State in Relation to Labour*, p. 154).

II. Where there is a monopolist, sole or corporate, on the one side, and on the other side an indefinite number of buyers, or sellers, competing with each other, the most general principle is that the monopolist will beat down the other parties to the point at which each of them is only just a gainer by his bargain; the addition to the total utility of each will be a minimum. The "law of indifference" that there should be one price in a market is not in general true of monopoly. The oppressiveness of the monopolist is modified by regard for his own future interests, as when an American railway company "builds up" a customer by giving him favourable terms, by fear of competition and of public opinion, and other considerations not here relevant (see MONOPOLY).

Mere convenience will often prompt the monopolist, instead of making separate terms in each transaction, as theoretically conceivable, to prescribe rates for classes of persons and goods. These charges are not in general proportioned to the cost incurred. Thus soldiers, in some foreign theatres, are admitted at a different rate from citizens; though the accommodation of the former may be as good as that of the latter. The differences between first and third class passenger fares, and between the rates for different kinds of goods, do not correspond to the outlay of the company in each case. For the object of the monopolist is to render his net profits a maximum; and this result will not in general be reached by apportioning charge to cost. True, if the cost changes, the arrangement most advantageous to the monopolist is apt thereby to be disturbed, and accordingly the charge will be in general altered, but not *proportionately* to the cost. Thus a tax on a monopolised article will in general increase the price, yet not equally with the tax, but, as it happens, by either more or less (Cournot, *Théorie Mathématique*, ch. vi.); the assertion which is often made that the charge will be unaffected by the tax is true only where the tax is a lump sum, not of a specific or an *ad valorem* tax.

In the case of monopoly then value is not measured by cost; but it is measured by utility: by total utility in case the monopolist takes the full advantage of his position; by final utility in the more usual case, where a rate is fixed for a class of commodities. In that case each consumer will go on purchasing up to the point at which it is just not worth his while to purchase another unit of commodity at the prevailing price.

III. The most general, or at least the most frequently treated, case is where there is unlimited competition on both sides of the market. This case may be subdivided into two: A, where value is not measured by cost of production, and B, where it is.

A, the first subdivision, corresponds to what Mill calls the "law of value anterior to cost of production, and more fundamental, the law of demand and supply" (see Mill, *Political Economy* bk. iii. ch. xvi. § 1, and Prof. Marshall's criticism of the passage; *Principles*, p. 544, 2nd edition). This case may be subdivided into two: (1) where production, or at least reproduction is impossible, or may be left out of account; (2) where this abstraction is not admissible.

(A1). To this head belong market values—not only commodities which cannot be multiplied rapidly, but also those of which the quantity in existence cannot be diminished rapidly, namely the precious metals in circulation (Mill, bk. iii. ch. ii. § 5). Prof. Marshall gives an instructive general type of the "temporary equilibrium" of market value; unaffected by cost of production which requires a "long period" in order to influence value (*Principles*, bk. v. ch. ii.).

Other articles referred by Mill to this category are "ancient sculptures, pictures by old masters, rare books or coins, or other articles of antiquarian curiosity" (*Political Economy*, bk. iii. ch. ii. § 2). Compare Prof. Marshall's enumeration of articles in the case of which "there is no connection between cost of reproduction and price" (at the end of the chapter last referred to).

Mill adds to his list of such articles "building grounds in a town of definite extent (such as Venice), the most desirable sites in any town whatever . . . potentially all land whatever" (*loc. cit.*). It should seem that his limitation of the statement to the case of "countries fully occupied and cultivated," is unnecessary. But it is impossible here adequately to discuss all the difficulties which the subject presents.

It is a nice question whether it is proper to

include in this section (A1) the exchange of present goods for future (cp. Böhm-Bawerk, *Positive Theory*), the settling of the rate of interest. Mill says "this is evidently a question of demand and supply" used in the same as in the preceding cases (*Political Economy*, iii. ch. xxiii. § 1). It is usual, however, to regard the "sacrifice" incurred by postponing consumption as a mode of *cost;* and so not to be included in this section.

(A2) To this class belong "commodities of which, though capable of being increased or diminished to a great extent, the value never depends upon anything but demand and supply" in a sense opposed to determination by cost of production (Mill, bk. iii. ch. ii., last paragraph). Perhaps the most typical case under this head is international trade, where in Cairnes's phrase (*Leading Principles*, bk. iii. ch. iv. § 4), cost "controls" but does not "determine" value; in the terms above used with respect to monopoly *affects*, but does not *measure*, value. Thus suppose tea produced in China exchanges for cutlery made in England. There is no equation between the efforts and sacrifices of the Chinese and the British producer. For the *mobility* tending to produce that equation is wanting. As an additional verification that value is not proportioned to cost in this case, it may be observed that if the cost of production be altered, *e.g.* by an improvement or a tax, the value in the international market will be altered indeed, but not in proportion to the alteration of the cost (Mill, bk. iii. ch. xviii. § 5, and bk. v. ch. iv. § 6).

The cognate case of "non-competing groups" (Cairnes) is amenable to the same law. The labour-market (cp. Mill, bk. iii. ch. ii. last par.) forms a particularly important instance —so far as it is legitimate to abstract efforts and sacrifices incurred with a view to preparation for that market (see below, p. 762, col. 1, par. 3).

Throughout the whole class of transactions which have been considered (A) there is wanting that adjustment between remuneration and effort and sacrifice which is the essence of the classical doctrine that cost of production determines value. Up to this point those who have impugned or ignored that doctrine are correct.

(B) A transition from the *régime* of "non-competing groups," to "industrial competition" (Cairnes) is obtained by supposing removed the barriers which have prevented competition. There ensues with the mobility of industry the equation of "net advantages" (Marshall) in different occupations. It will be convenient to break up class B in two: (1) where abstraction is made of division of labour; (2) more concrete.

(B1) Suppose each worker free to apply his labour in *doses*, or increments, to any industry —the abstract supposition implicitly made by Jevons in his analysis of labour (*Theory*, ch. vi.). No one will work in any branch beyond the point at which the trouble attending the last increment of product is just compensated by its remuneration. In this case then it becomes true that value is measured by the final disutility of the producer; while it does not cease to be true that, as in former cases, value is measured by the final utility of the consumer. There is no opposition between these verities; one need not be subordinated to the other.

In this case the relation between the two factors of value, utility and disutility, is almost as symmetrical as in what Prof. Marshall calls "the simplest case of equilibrium between desire and effort when a person satisfies one of his wants by his own direct action, as for instance when he picks blackberries. . . . After he has eaten a good deal the desire for more diminishes, while the task of picking begins to cause weariness which at last counterbalances the desire for eating, and equilibrium is reached." (*Principles*, bk. v. ch. iii. § 1). In such a case the question whether it was the desire, or the weariness, which "determined," or "regulated" the equilibrium would be insignificant.

The "fundamental symmetry" (Marshall) between the forces of demand and supply is aptly represented by mechanical illustrations. "Just in the same way, when several balls are lying in a bowl, they mutually determine one another's positions; and again, when a heavy weight is suspended by several elastic strings of different strengths and lengths, the equilibrium positions of all the strings and the weight mutually determine one another" (Marshall, *Principles*, bk. vi. ch. i.). The principle that water seeks its own level has been employed by Dr. Irving Fisher in his masterly *Investigations in the Theory of Value and Prices* (from *Transactions of Connecticut Academy*, vol. ix., July 1892) to construct a more elaborate illustration of the great principle thus enounced by Cournot, "Le système économique est un ensemble dont toutes les parties se tiennent et réagissent les unes sur les autres."

What has been said of the relation of disutility to value applies equally, or even better, to the "sacrifice" of postponing consumption. As Prof. J. B. Clark well says (*Yale Review*, No. 3), "the final act of abstinence is like the last act of labour, the costliest of all" . . . "the cost entailed on society by its final acts of abstinence is a second possible measure of value." It may be observed that the abstraction proper to this section (B1) is not so violent in the case of capital as labour. The idea of a capitalist distributing his outlay among different enterprises, from each of which *ceteris paribus* he will expect a similar return—is one that is partially realised in the "share" market. Compare Cournot, *Principes de la Théorie des Richesses*, 1863, Art. 45.

(B2) The "fundamental symmetry" between

utility and disutility as factors of value, continues to subsist when we restore the concrete circumstance of division of labour. But superficial differences arise. The individual may be conceived as seeking to maximise his total utility, *per saltum* by a change of occupations, rather than by doses distributed at different points of the industrial system. The equation of "net advantages" in different occupations, rather than of final disutilities, is now the condition. But the analogy of physical equilibrium is still appropriate. "The normal value of everything rests, like the keystone of an arch, balanced between the contending pressures on its two opposing sides. The forces of demand press on the one side, those of supply on the other" (Marshall). We must regard "the various elements of an economic problem—not as determining one another in a chain of causation—A determining B, B determining C, and so on—but as all mutually determining one another" (*ibid.* preface to 1st ed., p. xiv.).

To rightly apprehend the relation between value and cost of production it should be considered that one occupation may comprise several commodities. The production of different articles has been joined together by nature or custom. It would be idle to expect the value of beef and hides to be respectively proportioned to the quantity of labour "worked up" (Ricardo) or "congealed" (Marx) in each. A person who chooses a literary or academic career may hope to be, on the whole, as well off in that as in any other line open to him; but he must not expect the pay of each particular task—*e.g.* writing an article, or giving a lecture—to be proportioned to the trouble (cp. Mill on *Subsidiary Industries*, bk. ii. ch. xiv., and see JOINT PRODUCTION).

The sense in which value, in the case under consideration (B2), is determined by cost of production, as well as marginal utility, appears to the present writer to have been best stated by Prof. Marshall. Besides showing the interdependence of the two factors, as above mentioned, he also makes it clear that *time*, "a long period," is required in order that the forces of supply should work themselves out. Thus in the case of labour the adjustment between cost and value must be dated from the time when parents begin to make efforts and sacrifices with a view to the education and advancement of their children. There is presented the vast conception of trained industry put upon a future labour-market, by parental providence, for vicarious remuneration.

But perhaps no form of words devised by one person can be expected to recommend itself to all others as the best adapted to express the subtle relations of utility and cost to value. As in higher spheres of speculation, it may be hoped that differences of doctrine are less important than at first sight would appear.

Smart), bk. iv. ch. ii.—Edgeworth, *Mathematical Psychics*, p. 21, *et seq.*—Jevons, *Theory of Political Economy*, pp. 130-137, and Marshall, *Principles of Economics*, p. 715; Mathematical Appendix, Note xii.—Menger, *Grundsätze*, pp. 176-178.—Price, *Industrial Peace*, pp. 14 and 54.—Sidgwick, *Political Economy*, bk. ii. ch. x. § 3 (end), also p. 349.

On the abstract theory of monopoly, see Cournot, *Principes Mathématiques*, chs. v. and vi. *et passim.*—Hadley, *Railway Transportation*, and other books and reports relating to railways.—Marshall, *Principles of Economics*, bk. v.

The authorities on the more general case of value in exchange defy quotation by their number. Those to whom the present writer is most indebted have been mentioned in the text.] F. Y. E.

EXCHANGE, VALUE IN. HISTORY OF GROWTH OF THEORY. For the purpose of an elementary survey of the history of the theory of value we may roughly divide the various theorists into two "schools"—the "cost-of-production" school and the "utility" school. The "cost" school is the older; its sway over our science has only begun to be broken in the last few decades by the "utility" school, the earliest quite consistent representatives of which wrote in the middle of the 19th century.

The "cost-of-production" school.—The first step towards an analysis of the economic phenomenon of value consisted in a discrimination between value in use and value in exchange. Aristotle makes this important distinction: "To take *e.g.* a shoe, there is its use as a covering of the foot, and also its use as an article of exchange" (*Polit.*, i. 9, p. 22 of Welldon's Transl.). His example is followed, among English economic thinkers, by Locke ("Considerations of the lowering of interest and raising the value of money," in *Works*, ed. 1714, ii. p. 21) in the end of the 17th, and by Hutcheson (*System of Moral Philosophy*, 1755, ii. p. 53) in the middle of the 18th century. Locke, *l.c.*, speaks of "the intrinsic natural worth of anything," as separate from its "value"; and Hutcheson, *l.c.*, observes that "the prices and values in commerce do not at all follow the real use or importance of goods for the support . . . of life." French physiocrats (*e.g.* Dupont and Quesnay), speak of *valeur usuelle* and *valeur vénale;* and Turgot distinguishes between *valeur estimative* and *valeur commerçable* or *échangeable*, defining the first as a purely individual, the second as an essentially social mode of weighing the sacrifice, necessary in order to get possession of the commodity, against the enjoyment of possessing it. English economic treatises of the 18th century sometimes show an appreciation of the difference between use value and

exchange value by discriminating between the words "worth" and "value."

When Adam Smith wrote his *Wealth of Nations*, he made this old primary analysis of value the basis of further analysis. He first hints that "things" must have some "value in use" in order to have any "value in exchange," and then for a time entirely drops "value in use" out of the discussion, proceeding to investigate "what is the real measure of this exchangeable value; or, wherein consists the real price of all commodities," and "what are the different parts of which this real price is composed or made up" (bk. i. ch. iv. p. 42, ed. 1793). He does not explicitly treat the problem: How does value measure men's desires to possess, or consume, commodities? This significant feature is, however, to be found among the French physiocrats. Turgot—("Valeurs et Monnaies," in *Œuvres*, ed. Daire, vol. i. p. 83) says: "For an isolated individual, the *valeur estimative* of an object is precisely that portion of his total faculties (*la portion du total de ses facultés*), which corresponds to his desire for the object, or which he is willing to employ in order to satisfy this desire." Adam Smith proceeds (comp. bk. i. ch. iv. and ch. vii.) to discuss "the different circumstances which sometimes raise some or all of these different parts of price above, and sometimes sink them below their natural and ordinary rate," *i.e.* their cost of production—or "the whole value of the rent, labour, and profit, which must be paid in order to bring" the commodity to market. Here he looks at the problem chiefly from the point of view of the seller, as if exchange were regulated almost exclusively by estimates of labour or cost. In this connection he uses "worth" and "cost" as identical terms. The manner in which Adam Smith treated this question gave rise to that school of economic thinking which (to use the phrase of Professor Nicholson, art. "Value" in *Ency. Brit.*) regards utility "simply as a kind of entrance examination which every commodity must pass to enter the list of valuables, whilst the place in the list is determined by variations in the degree of the difficulty of attainment."

Ricardo states: "Utility then is not the measure of exchangeable value, although it is absolutely essential to it" (*Principles*, ed. Gonner, p. 5). Elsewhere (pp. 7, 8), Ricardo speaks of labour as the "foundation of the exchangeable value," and of "quantity of labour realised in commodities" as "regulating their exchangeable value."

Malthus (*Principles*, ed. 1820, p. 52) sees that value in exchange "does not depend merely upon the scarcity in which commodities exist . . . but upon the circumstance of their not being distributed . . . in such quantities to each as the wills and powers of individuals will enable them ultimately to effect by means of exchanges." He does not, however, search further into the relation between "such quantities" and their value in use. This latter term he describes in his *Definitions* (ed. 1827, p. 234) as being "synonymous with utility. It rarely occurs in political economy, and is never implied by the word value when used alone."

J. S. Mill emphasises more strongly than his predecessors the importance of the play of supply and demand in determining exchange value. He, however, retains Ricardo's notion of two laws of value: one for commodities that "are susceptible of being multiplied at pleasure," and another for commodities that are not. These latter, "no doubt, are exceptions," and it is for these latter that he conceives his supply-and-demand theory of value (*Principles*, bk. iii. ch. ii.).

Karl Marx, the founder of German social democracy, seeks, on the lines of Hegelian dialectics, to separate value in use totally from value in exchange. The latter is "something quite independent" of value in use; and an investigation of value in use may be of some good in commercial education, as "die Disciplin der Waarenkunde," but does not belong to economic science, though "nothing can have exchange value without being a thing of utility" (*Das Kapital*, ed. 1883, pp. 2 and 8). Exchange value, Marx continues, is a ratio, and as where there is a ratio there must be homogeneity, he arrives at the conclusion that commodities can only be homogeneous as products of human labour. This, therefore, determines value. Marx's theories, though they have never been accepted by any economist of note, are worth consideration, partly because of their enormous influence on socialistic workmen in different parts of the world; partly because they undoubtedly display some of the worst consequences of consistently neglecting to analyse consumption or demand as carefully as production or supply.

Turning to the French, German, and other Continental theorists of the cost-of-production school, we find that, with few exceptions, they have been far more disposed to devote attention to the utility element of value in exchange than the "classic" English school from Smith to Fawcett. Though there are most important scientific divergences between the majority of 19th century German economists and the new "Austrian school," it is still by no means difficult to look upon the former as slowly and laboriously paving the way for the latter.

J. B. Say indicated (*Traité*, ed. 1803, ii. p. 58) that the fundamental elements of value in exchange were, the quantities offered and demanded, and the expense of production, which latter he called "the natural value" of the commodity. He set the example for later French

economists of treating the value problem as essentially dealing with the laws which determine when and how "utilities" exchange against one another. "No doubt what determines us to give up a commodity which we possess in order to get another is some quality in this other commodity which pleases us, and which quality is not to be found, or to be found only in less amount (*à moindre dose*) in the commodity which we give in exchange" (Coquelin and Guillaumin, *Dict. de l'Éc. Pol.*, 1853, vol. ii. p. 808)—this, and not the cost of production, is the starting point of most French discussions of value. J. Garnier's definition (*Traité d'Éc. Pol.*, ed. 1889, p. 280): "things have value in exchange when they are useful and, at the same time, transferable and scarce; that is to say, value in exchange is exchangeable utility, corresponding to the amount of labour which the thing saves, and, in most cases, owing its existence to labour and other expenses," is characteristic of the standpoint of many French economists. An exception from the general French attitude is F. Bastiat, notable not so much for solid scientific merits as for a widespread popularity. He defines value in exchange as "the proportion (*rapport*) between two services exchanged" (*Harmonies Économiques*, ed. 1851, p. 118).

Among most German economists of the 19th century there is a tendency to treat utility as of at least equal importance with cost of production in the determination of exchange value, "The value in exchange of a commodity, or its suitableness for the purpose of being exchanged against other commodities, depends upon that combination between use-value and cost-value which has its rise in the economic relations of men one with another," writes W. Roscher in his *System der Volkswirthschaft*, ed. 1882, i. p. 10. And Schäffle defines value in exchange as "a disguised comparison between the cost-values and the use-values of the two commodities which are to be exchanged against each other" (*Kapitalismus und Socialismus*, p. 35). In his *Bau und Leben des socialen Körpers*, ed. 1878, iii. p. 279, the same writer shows that exchange value is at the same time an individual and a social phenomenon. Adolph Wagner (*Allgem. od. theoret. Volksw.*, Thl. I., *Grundlegung*, ed. 1876, p. 47) says that "the exchange value of a commodity depends, for the individual who demands it, upon its degree of concrete utility for him, and upon the difficulty of getting it." Wagner is careful to observe that value in use is "the foundation of all the estimates" which determine exchange value, and that difficulty of attainment is an incident which, though in most cases present, can by no means be used exclusively for the definition of exchange value. The position of the majority of living German economists is also well represented by Professor Neumann in Schönberg's *Handb. d. Pol. Oek.*, ed. 1885, vol. i. p. 156, etc. He proposes to abandon the phrases "value in use" and "value in exchange" as not sufficiently emphasising the all-important personal element in value. The essential thing in all the varying meanings of value (*Werth*) is "the estimate (*Beurtheilung*) of the usefulness or fitness of a thing for human interests, wants, or aims." Neumann, however, does not enter into any far-reaching examination of the relations between his subjective and objective "categories of value." This intermediate position between the extreme cost-of-production school and the modern utility school is, however, not taken by Max Wirth, Prince Smith, and several other German "free traders." Their value theory is very closely related to that of BASTIAT (*q.v.*) and to that of the classic English school. Another notable dissenter from the majority of German economists is Eugen Dühring. He has adopted the value theory of H. C. Carey, according to whom value "results exclusively from labour." Value in exchange is "the measure of the resistance offered by nature, to the possession of the things desired," or "the measure of the power of nature over man" (*Principles of Social Science*, ed. 1877, ch. vi. § 88). The economic writers among the German social democrats continue to follow Karl Marx.

[In the following works are to be found references to the more important writers of the cost-of-production school both in England and on the Continent. W. Roscher, *System der Volkswirthschaft*, ed. 1882, vol. i. p. 10-12, footnotes.—Adolph Wagner, *Grundlegung*, ed. 1876, pp. 37-40, 43, footnotes.—Schönberg, *Handbuch*, ed. 1885, vol. i. p. 156, footnote; also footnotes to several of the following fifteen pages.—Coquelin et Guillaumin, *Dictionnaire de l'Éc. Pol.*, 1853, article "Valeur."—J. Garnier, *Traité d'Éc. Pol.*, ed. 1889, pp. 275-280, 692-694.—J. R. M'Culloch, *Literature of Pol. Ec.*, ch. i.—J. K. Ingram, *History of Pol. Ec.*, 1888.—L. L. Price, *History of Engl. Pol. Ec.* since Adam Smith, 1890.—K. Marx, *Das Kapital*, vol. i., footnotes to ch. i.—E. von Böhm-Bawerk's *Kapital und Kapitalzins* (Engl. Transl. by W. Smart), contains in its historical part, vol. i., a great number of bibliographical references, which are very useful to a student of the history of the general theory of value, though the book deals only with the history of the theory of interest.—Specially for Italian theory: Augusto Graziani, *Storia critica della Teoria del Valore in Italia*, Milano, 1889.—Specially for early German theory: W. Roscher, *Geschichte der National-ökonomik in Deutschland*, 1874.]

The "Utility" School.—Though all economists insist that "utility is indispensable to value," and though many of the writers who have been classed as belonging to the cost-of-production school strongly emphasised the great importance of utility to value in exchange, they never succeeded in working out a consistent

quantitative theory of the general and necessary connection between utility and value in exchange. To have done this is the scientific characteristic of the "utility school." The principal achievements of this school, as far as they concern the general theory of value, consist (1) in the discovery of the connection between the variation of the utility to an individual of a unit of a commodity and the variation of the number of such units possessed or commanded by him; and (2) in the discovery of the law of the marginal determination of all forms of exchange value (see MARGIN). These discoveries led to the important distinction between total utility and degree of utility, and to the unravelling of the complicated connection between exchange value as determined in a market, under the influence of free competition between producers and consumers, and the marginal degree of utility of a unit of the commodity to individual dealers in the market. These deductions have led to the general theory that *value in exchange is a relative marginal degree of utility and a function of quantity possessed.* Hence it is concluded that variations in cost of production or difficulty of attainment can never directly affect or, strictly speaking, determine value in exchange, but only indirectly affect it, when and in so far as the variations in cost of production affect quantity possessed — such conditions as time and FRICTION (*q.v.*) being taken into account. What directly determines exchange value is not the desire to avoid work, the root idea of the "cost" school, but the desire to possess the commodity—not the production, the past history of the commodity, but the consumption, the future destiny of the commodity. This theory is the result of quantitative analyses of CONSUMPTION (*q.v.*). The "cost" school had in a very conspicuous manner neglected the theory of consumption—had indeed often denied that there could be such a thing. The "utility" school, on the contrary, looks upon the quantitative theory of consumption as the only sound basis of economic theory in general.

The root idea of the "utility" theory is to be found in economic treatises from the earliest time, *e.g.* Aristotle. "It follows," he wrote, "that such things as are the subjects of exchange must, in some sense, be comparable. . . . Money . . . measures everything, and consequently measures, among other things, excess or defect, *e.g.* the number of shoes which are equivalent to a house or a meal. . . . But this will be impossible unless the shoes and the house or meal are in some sense equalised. Hence arises the necessity of a single universal standard of measurement. . . . This standard is in truth the demand for mutual services, which holds society together; for if people had no wants, or their wants were dissimilar, there would be either no exchange, or it would not be the same as it is now" (*Nic. Ethics*, v. 8, p. 152 of Welldon's transl.). Condillac (*Le Commerce et le Gouvernement*, ed. Daire, 1847, p. 250) observes: "We say that a thing is useful when it serves one of our wants. . . . According to this utility we estimate the thing more or less. . . . Or, it is this estimate which we call value. . . . The value of things is then founded upon their utility, or, what amounts to the same, upon our wants for them, or, what still amounts to the same, upon the use we can make of them." B. Hildebrand (*National-ökonomie d. Gegenwart u. Zukunft*, 1848, p. 318) foreshadows the theory that value is determined by marginal utility and is a function of quantity wanted. The French engineer Dupuit, when attempting to find a measure for the utility of public works, observed that the utility of a commodity is often not only different for different individuals, but that it will vary enormously for the same individual when the quantity possessed or commanded by him varies. "The utility for the same individual of a piece of bread can grow from zero to the amount of his whole fortune" ("De l'influence des péages sur l'utilité des voies de communication," in *Annales des ponts et chaussées*, 1849, p. 185; also "De la mesure de l'utilité des travaux publics," in *Annales*, 1844). Dupuit states (*Annales*, 1849, p. 172) that his theory is an elaboration of that of P. L. O. Rossi, who considered the theory of utility as the true basis of economics. Other more or less fragmentary attempts at building a value-theory upon an analysis of utility are to be found in writings of K. H. Rau, von Thünen, Friedländer, Knies, Schäffle, L. von Stein, A. Walras, Th. de Quincey, Samuel Bailey, R. Jennings, and others (see the bibliographical notes by Menger and Jevons referred to below).

The first economists who succeeded in establishing and elaborating a consistent theory of value by a thorough analysis of consumption or demand, were A. Cournot and H. H. Gossen. In his *Recherches sur les Principes mathématiques de la Théorie des Richesses* (Paris, 1838) Cournot observes (p. 22): "What is truly important is to know the laws which govern the variations of values, or, otherwise expressed, to have a theory of wealth. This theory alone will allow us to show to what absolute variations are due those relative variations" (in values) "which fall within the field of observation." In the chapter on "the law of demand" Cournot writes: "Let us then assume that the annual demand D for each commodity is a special function F (p) of the price p of this commodity. To know the forms of this function would be to know what we call the law of demand. . . . The form of the function would evidently depend upon the nature of the utility of the commodity, upon the nature of the services which it can render, or upon the

enjoyments which it can procure, upon the habits and the customs of each people, upon the average wealth and upon the scale according to which this wealth is divided" (p. 50). Cournot proceeds to argue (p. 56) that "as the function F (p) is continuous, the function pF (p), which expresses the total value of the quantity annually demanded, must also be continuous." Further, it is possible to assign to p such a small value that pF (p) becomes zero, and also to assign to p so high a value that the same happens. It is easily seen that these quantitative relations between price and quantity demanded at that price have their exact analogy in the subjective fact, not treated by Cournot, that the value in exchange of a commodity is the differential coefficient of its value in use.

The treatise by Gossen entitled *Entwickelung der Gesetze des menschlichen Verkehrs und der daraus fliessenden Regeln für menschliches Handeln* (1st ed., Braunschweig, 1854), opens with the explicit assumption of economics being the theory of pleasure and pain—economic activity having for its aim the realising of a maximum of pleasure with a minimum of pain. He proceeds in a strictly logical sequence to expound the theories of utility, of labour, and of exchange. "The magnitude of the same desire," writes Gossen, "diminishes steadily, when we without interruption continue to administer to it, till at last a state of satiety is reached" (p. 4). He distinguishes between total utility, degree of utility, and marginal degree of utility.

The two early pioneers of the utility theory of value, Cournot and Gossen, failed to gain recognition. Their suggestive writings were practically unknown at the time when W. S. Jevons, Karl Menger, and Léon Walras, early in the seventies, published independently of each other their epoch-making treatises.

Jevons as early as 1860 thought out the outline of his theory, and had in 1862 published a preliminary notice of the same. His well-known *Theory of Political Economy* (1st ed. 1871, 3rd ed. 1888) has exercised a great reforming influence. Its most salient and enduring feature is the profoundly philosophical spirit in which its early chapters deal with the method and very foundation of the science. In his introduction (ch. i.) Jevons contends "that economics, if it is to be a science at all, must be a mathematical science . . . simply because it deals with quantities" (pp. 3, 4, 2nd ed., 1879). Having shown the mathematical connection between total utility, or value in use, and degrees of utility, having framed the law of variation of final or marginal degree of utility, and having shown how this law rules the distribution of a commodity in different uses, he only needs to define MARKET (*q.v.*) and to formulate the LAW OF INDIFFERENCE (*q.v.*) to lay the foundation of his theory of exchange (ch. iv.). This is expressed in the words: "The ratio of exchange of any two commodities will be the reciprocal of the ratio of the final degrees of utility of the quantities of commodity available for consumption after the exchange is completed" (p. 103). Jevons continues: "There are two steps between labour and value. Labour affects supply, and supply affects the degree of utility, which governs value, or the ratio of exchange" (p. 179).

Léon Walras, in *Éléments d'Économie politique pure, ou Théorie de la Richesse sociale* (1874), and subsequent works supported the same theory of value as Jevons, the chief point of difference being one of terminology. Walras, for example, often using the highly concentrated and therefore rather ambiguous term rarity (*rareté*) instead of final or marginal degree of utility. Léon Walras developed the mathematical utility theory of value expounded by his father A. Walras, and he also utilised the work of A. Cournot above referred to.

Karl Menger published his *Grundsätze der Volkswirthschaftslehre* in the same year as Jevons his *Theory* (1871). In the preface he announces as his object to frame so general a theory of price that it accounts not only for price of commodities but also for interest, wages, rent, etc. (p. x.). He approaches his subject by way of an elaborate analysis of the economic significance of goods (*Güter* as distinct from *Waaren* or commodities), and he establishes in the very first chapter the doctrine of the different "orders" of goods—a very characteristic part of his theory, and valuable as an attempt to broach the special problems of the value of tools or of goods which only indirectly serve our life. Menger's theory of value (pp. 98-99 and 107-108) is in substance the same as that of Jevons and Walras though not formulated with the same amount of precision.

[Between the years 1875 and 1890 there grew up in England, America, Austria, Germany, Holland, Italy, France, and Denmark, a "school" of economists engaged in developing the science on the lines of Jevons, Walras, or Menger. The well-known treatises of such Continental economists as E. von Böhm-Bawerk, Friedrich von Wieser, Wilhelm Launhardt, R. Auspitz, and R. Lieben, N. G. Pierson, Emil Sax, Harald Westergaard, are all founded upon the utility theory of value. The new theory has, besides, exercised a very marked influence on many prominent economists of the present day who, like Professor H. Sidgwick and Professor F. A. Walker, cannot be said actually to belong to this "utility school."

Among English treatises distinctly belonging to the "utility school," we can only mention a few. F. Y. Edgeworth's *Mathematical Psychics* (1881) is interesting as an attempt at utilising the new theory for establishing, on strictly mathematical lines, a science of social life. *The Alphabet of Economic Science*, by Ph. H. Wicksteed (1888), takes up the theory of value of Jevons, and gives a popular explanation of the fundamental

theorems of the higher mathematics upon which it rests. Professor A. Marshall, in his *Principles of Economics*, vol. i. (1890), shows the true organic connection between the modern theory and the doctrines of the leading economists of the past.

The most complete bibliography to the value theory of the utility school is found in the appendix to W. S. Jevons's *Theory of Political Economy*, ed. 1888. See also: Carl Menger, *Grundsätze der Volkswirthschaftslehre*, thl. i. 1872 (notes to pp. 78-80, 108-113, 215-216, are excellent as a guide to German writers on the subject); Léon Walras, *Théorie de la Monnaie*, 1886, pp. vii.-ix.—Auspitz and Lieben, *Untersuchungen über die Theorie des Preises*, 1889 (preface).—Graziani, *Storia critica della Teoria del Valore in Italia*.—R. Zuckerkandl, article "Preis" in Conrad's *Handw. b. d. Staatsw.*, also same writer's *Zur Theorie des Preises*, 1889.—E. Cannan, *History of the Theories of Production and Distribution in English Pol. Ec. 1776-1848*, 8vo, 1893.] G. F. S.

EXCHANGE (USURY). See USURY.

EXCHANGE, as BOURSE. (*a*) A place where merchants, bankers, brokers, etc., assemble at certain hours for the transaction of business; and (*b*) the assemblage itself. In both senses the word is commonly contracted into 'Change.

"The last yere, I shewyd your goode lordeshipe a platte, that was drawen howte for to make a goodely Bursse in Lombert strette for marchaunts to repayer unto. I doo suppose yt wyll coste ii. M. li (£2000) and more, wyche shalbe very beautyfull to the citti, and allsoo for the honor of our soverayngne lord the Kinge." Thus wrote Lord Mayor Sir Richard Gresham in 1538 to Cromwell, the lord privy seal. He had recently seen and admired the new *Burse* at Antwerp, and was anxious that London merchants, whose custom it was to congregate twice a day in the open air in Lombard Street, should be provided with a similar house, or covered walk, to shelter them from the inclemency of the weather. But powerfully as he advocated the scheme, it did not find favour. Owners of property were difficult to treat with; and, as the merchants themselves appear to have been completely indifferent, the plan was suffered to fall through. After the lapse of a quarter of a century, it was however again brought forward by his public-spirited son, Sir Thomas Gresham. On the death of his only child in 1564, Sir Thomas appears to have conceived the idea of making his country his principal heir; he munificently offered, provided the city would furnish a suitable site, to erect the building at his own expense. His fellow-citizens gratefully accepted the offer; they raised a sufficient sum by subscription, purchased the piece of land on which the Royal Exchange now stands, and conveyed it over to him. By the end of 1568, merchants were able to hold their meetings within the building. It consisted of a quadrangular arcade, enclosing an open court, and bore a general resemblance to the *Burse* at Antwerp. After completion, it was inspected and formally opened (23rd January 1571) by Queen Elizabeth, who "caused the same Burse by an herralde and a trompet to be proclaimed the *Royal Exchange*, and so to be called from thenceforth, and not otherwise." By Gresham's will the Royal Exchange was vested in the Corporation of the City of London and the Mercers' Company, conjointly. And to them it in due time reverted. Exactly 100 years after the laying of the foundation stone the building was swept away in the great fire of 1666; and its successor, the second exchange, was also destroyed by fire in 1838. The present structure dates from 1844.

To the stranger who visits the Royal Exchange, expecting to find there the very heart of the business of London, the deserted appearance of its interior is a source of wonderment; with the exception of a short interval in the afternoon, when it is resorted to by dealers in some of the minor branches of commerce (paper, drugs, etc.), and of an hour or so on Tuesdays and Thursdays, when foreign bills are dealt in, it appears to be given over to loungers. It has to a great extent outlived its object. In Gresham's time, and for long afterwards, the space afforded by the quadrangle and ambulatory was sufficient for all requirements, but to-day the building would hardly give standing-room to a tithe of those who every day come together in the city to discuss and transact affairs; long ago it became apparent either that the exchange must be enlarged, or that some of those who frequented it must go elsewhere. One after another, the larger and wealthier traders departed and built homes for themselves in more convenient localities. Dealers in stocks and shares, produce merchants, shipowners, insurance underwriters, coal, metal, corn, hop, wool-traders, and others, now possess their own separate exchanges. There is one small but important group which transacts business in the old parent centre, and which the mind more particularly associates with the word "'Change." On Tuesdays and Thursdays, after luncheon time, the principals of the great merchant-banking houses (Rothschild, Baring, Huth, Kleinwort, etc.), the representatives of a few of the more enterprising joint-stock banks (London County and Westminster, London City and Midland, Martins, etc.), and the London Branch managers of all the foreign and Anglo-foreign banks (Crédit Lyonnais, Deutsche Bank, Swiss Bankverein, Anglo-Austrian Bank, etc.), collect at the eastern end of the courtyard to discuss matters of common interest and to deal in foreign bills. The attendance is never more, perhaps, including the brokers, than five or six score; but it comprises members of firms whose names are "household words" on every bourse throughout the world, and is eminently representative of the financial side of England's

Welthandel. Hubbub and excitement, apparently necessary concomitants of the dealings in other commercial assemblies, are here absent; the negotiations are conducted in a quiet undertone, and with an air of nonchalance which might almost lead the onlooker to believe that the chief object of the meeting is conversation, and that business is quite a secondary consideration.

Formerly the foreign mails were despatched from London twice a week, on Tuesdays and Fridays, and on these "post days" alone were foreign bills negotiable on "'Change." The custom of a bi-weekly meeting (since 1879 Tuesday and Thursday) still subsists, as it is found that so far as the business in bills of exchange is concerned, two exchange-days are sufficient for all practical purposes, and are perhaps more advantageous than a daily market would be, inasmuch as they collect on the same spot and at the same time all the important buyers, and therefore establish a genuine quotation. The business in cheques and telegraphic transfers, which has now attained huge proportions, is of too urgent a nature to wait for "post-day," and is effected daily and hourly by telephone.

Owing to the fact that the settlement by bill of our mercantile transactions with other countries is usually effected by means of drafts on London from abroad—the bills drawn on abroad from England forming only a very small fraction of the whole, that is to say, our exporters, instead of drawing against their sales, mostly arrange to have remittances sent them; and our importers, instead of remitting against their purchases, mostly arrange to accept,—the traffic in "London" paper on the Continental bourses is on a far larger scale than that of the dealings in foreign bills on the Royal Exchange; and the buying and selling of long or short "London," either for the portfolio—as stock-in-trade, investment, or speculation, as the case may be—or in execution of orders received from customers, is part of the regular round of a Continental banker's duties, and necessitates his daily attendance at the bourse. An English banker, on the contrary, is rarely or never seen on "'Change," as he confines his bill-operations to paper payable at home, and immediately disposes through his broker of whatever foreign paper may be sent up to him from the provinces for negotiation. A notable consequence of this predominance of foreign-drawn over English-drawn paper in the various markets is that the course of most of the exchanges is controlled from abroad, and that the fluctuations registered here are mere reflections of the movements produced by forces operating on the other side. G. C.

EXCHANGE, STOCK. The largest stock exchange in the world is that of London, in which securities to the nominal value of not less than £10,000,000,000 are marketable (1914). These securities are officially recognised, and there are besides numbers which have no official quotation, but are yet dealt in from time to time according to the speculative rage of the moment. There are also in the United Kingdom twenty other exchanges, including Manchester, Liverpool, Leeds, Sheffield, Newcastle, Birmingham, Bristol, Aberdeen, Edinburgh, Glasgow, Dublin, Belfast, Cardiff, Halifax, Huddersfield. The whole of these do not include the attendance of as many persons, or turnover of so much money and securities, as the London stock exchange alone. Their business, however, presents some points worthy of notice (see EXCHANGE, STOCK, PROVINCIAL). The London stock exchange is not only the chief of the English stock markets; it is also linked internationally with nearly all the financial centres of the world, and it would be difficult to name a security which could not find a market in London, either through the ordinary channels provided by *arbitrage* dealers (see ARBITRAGE), who buy in the cheaper and sell in the dearer markets, or through the agency of trusts which, by the aid of English investments, form funds applied to the purchase of a vast variety of securities in European, Asiatic, American, and Australian exchanges as well as those which are of native production. There has never been anything in history like the London stock exchange for magnitude and extent of financial resources. It is an immense business engine with certain unavoidable drawbacks which give it also the nature of an extensive gambling centre. On the whole, it has been found by experience that the advantages and merits of such an organisation outweigh altogether the drawbacks imposed by the too-speculative spirit of mankind. It has been asserted, and even by members of the stock exchange, that nine-tenths of the operations on which stockbrokers live by commission are gambling operations. And though no doubt the speculative public pay annually a heavy tax to the professional stock exchange element—rough estimates are made that in prosperous years the annual revenue of members of the London stock exchange may amount to £3,000,000 or £4,000,000,—yet the stock exchange provides a useful barometer; and sometimes by its extreme sensitiveness to events which have yet to happen, eases and mitigates the effects of disasters which would otherwise have assumed proportions of a national calamity. The stock exchange is always running ahead of anticipated events, and the events when they happen, being so "discounted," have the less effect if any effect at all. This is by no means the only public service done by the stock exchange. The modern fashion of turning over growing private undertakings into joint-stock companies makes the stock exchange a necessity. It is also a means by which astute men of business can

insure, or hedge, against the worst results of what would otherwise be a hazardous operation. Thus the stock exchange is often used as a hedge against commercial contracts. For example, if a group or firm of contractors have undertaken to supply steel rails for a South American railway at an advantageous rate, the chief contingency to be guarded against is default or discredit on the part of the state. While undertaking to contract on the one hand, they find it advisable to acquire the option to deliver stock at fixed prices on the stock exchange; so that, whatever happens, there is no great or irreparable loss to be feared. There has also scarcely been a boom in American securities in recent years without the life of Mr. Pierpont Morgan being insured by both London and Wall Street operators. Commercial operations which depend on the maintenance of peace in Europe can obviously be entered into with some sort of security when it is possible to hedge against disaster by recourse to the stock exchange. On the occasion of the coronation, both of King Edward VII. and of King George V., heavy insurances were effected at Lloyd's by stock exchange operators for the rise, on the risk of the death of the monarch. It is a two-edged tool, however, and can only be used safely by men of the greatest discretion and experience. We may usefully record here an extract from the conclusions of the royal commission on the London stock exchange, which reported in 1878 as follows:

"The public are enabled to count upon a reasonable speed and certainty in the transaction of business, and the vast amount of business done secures to those who deal in the London stock exchange as small a difference between the buying and selling prices as can be obtained in any other market. We think, however, that if it were possible, it would be desirable that the exchange should be open to the public,—not so much because an investor would in the event have any real control over the bargain which his broker might make for him, as for the purpose of removing a certain amount of jealousy and suspicion which is created in some minds by the present system." The stock exchange has not found it practicable to throw open its doors to the public, and it remains what it was—a strictly regulated club.

The report of the royal commissioners also contained these words: "In the main the existence of such an association, and the coercive action of the rules which it enforces upon the transaction of business and upon the conduct of its members, has been salutary to the interests of the public." The stock exchange having, or rather being, a valuable monopoly, it is not surprising that the tone of its government is exclusive. It has a share capital of £240,000, the shares being reckoned as £12 paid. The £12 shares are (in the year 1910) worth about £190 each, and none other than a member of the stock exchange is allowed to be a proprietor. For the year 1909-10, the dividend paid was £8 : 10s. a share, or 70 per cent of the share capital, and the net revenue of the year had been £211,810 : 2 : 3, after payment of interest at 3 per cent on £450,000 debentures. The share and debenture capital together are more than balanced by freehold and leasehold property, which stands at £1,080,628 : 6 : 7 in the accounts, and may be worth more. The value of the connection of the stock exchange may then be reckoned at something more than five millions sterling.

The management of the stock exchange has thus been good enough to stand the test of public opinion during the fast-working 19th century. About the year 1700, dealers in public securities found the accommodation in the Bank of England too small and migrated to 'Change Alley; thence to Sweetings Alley in 1773, where a room was engaged and kept up by subscription; and afterwards to Capel Court where, in the year 1802, a building was opened, but the public were excluded. There were at that time about 500 subscribers, and this was the formal beginning of the stock exchange, as it is now known. Seventy years ago the number of members was about 350, and now (1910) the number is 5019 besides 2344 clerks, who are admitted at reduced rates. The stock exchange included, as it still includes, a responsible body, a complete organisation, a local habitation, a public institution privately managed. Its Benevolent Fund is unique.

Mr. F. Levien, for many years secretary to the committee for general purposes, in his evidence before the royal commission in 1877, described the internal administration of the stock exchange in the following words: "The administration of the stock exchange is vested in two bodies, whose functions are distinct. First come the managers, who represent the proprietors or shareholders in the undertaking, under the deeds of 1802 and 1876, who are the executive of the landlords of the house and premises, have control over all monies paid for admission, fix annually the charge for admission of members for the year ensuing, appoint all officials, except the secretary to the committee for general purposes and the official assignees, and superintend all matters connected with the building, supplies, etc." He goes on to describe the functions of the committee for general purposes, who are the executive of the subscribers, and "have control over the business of the house; make and administer the rules and regulations for the conduct of the business of the stock exchange; adjudicate all questions between members and complaints against members by non-members, if desired to do so by the latter. They investigate the question whether their published requirements have been com-

plied with by governments and companies asking for settlements or official quotations, for loans or shares, and have vested in their hands the election by ballot of those who seek to become members of the stock exchange." This committee have been known to suspend or expel members for offences against the body, also for those against the public, seeing that such conduct would be calculated to bring the stock exchange into disrepute. On the whole, the management has been successful, and, again on the whole, is approved by public opinion. New members are elected and old members re-elected on the first Monday in March of each year. An applicant for membership must be recommended by three members of at least four years' standing, each of whom must pay £525 in case of default by the new member within four years of his admission. The full entrance fee is £525 and the annual subscription £42. (See BROKER; DEALER; JOBBER.) A. E.

EXCHANGE, STOCK, PROVINCIAL, IN GREAT BRITAIN AND IRELAND. The best known of these are at:—Aberdeen with 14 members, Belfast 32, Birmingham 60, Bradford 12, Bristol 32, Cardiff 19, Cork 23, Dublin 87, Dundee 18, Edinburgh 74, Glasgow 266, Greenock 12, Halifax 9, Huddersfield 11, Leeds 27, Liverpool 176, Manchester 104, Newcastle 16, Sheffield 39, and Southport 6; collectively (about the year 1910) 1037 members.

All are organised associations managed by committees, and the aggregate of yearly business transacted is very great. It is noted that cases of dispute and litigation between provincial brokers and clients are rare, and it is claimed on behalf of these institutions that no description of business in this country is carried on with greater rapidity and accuracy than that in which these exchanges are engaged.

Up to the year 1890 the provincial exchanges had no common understanding or organisation; but in that year the council of associated stock exchanges—that is to say of provincial stock exchanges—was established, a consultative body composed of delegates, generally the chairmen and deputy chairmen of the various exchanges. The council meets annually, or more frequently in cases of emergency; the presidency and administration being undertaken by the larger exchanges in turn. The provincial exchanges have undertaken the revision and codification of stock exchange rules with the object of securing identical arrangements in carrying on the business throughout the whole body of associated exchanges. Thus the notice of the rule of the Manchester stock exchange committee (*Economist*, January 7, 1911) is identical with that of the London stock exchange, with the difference that it is more stringent than the latter through the reference to the Prevention of Corruption Act 1906, and the rule that "no member of this exchange may divide commissions with any one." The first public action of this body was their successful attempt, by securing the guarantee of share titles, to avert from shareholders, in future, the disastrous possibilities opened out by the North Western Railway Company's now historical denial of their stock certificates. The London stock exchange declined to take action in the matter, until the principle of indefeasible titles to securities had been accepted by public bodies; the Forged Transfers' Acts, and the benefits resulting from them, will, accordingly, always be associated with the provincial exchanges, more especially with that of Liverpool, a member of which institution having secured the passing of these acts and put them into operation.

The business of the provincial stock exchanges consists largely of:—Transactions for investment in British, Canadian, and American railway stocks; dealings in shares of insurance, banking, shipping, commercial and industrial undertakings. The application of the Limited Liabilities Act adds largely to the number of these undertakings. Being practically brokers' markets, investors can there operate free from such profits as are absorbed by London dealers. The Association of Provincial Stock and Share Brokers, a new organisation which held its first annual meeting, June 27, 1914 (*Times*, June 29), promises to be useful.

EXCHANGE, FOREIGN. The term foreign exchange denotes the value at which an amount quoted in the currency of the country where the transaction originates is interchangeable with that of a foreign country. The quotation of foreign exchange fixes the market value, for the time being, of foreign currency in the place wherein the quotation is made. For instance, if the French exchange is quoted in London to-day at 25 frs. 20 c. for cheques on Paris, it means that for every sovereign a London banker would buy or sell 25 frs. 20 c. in a cheque on Paris—one must say buy *or* sell, because it is most unlikely that he would do both, for there is always a difference between buying and selling, therefore the quotation is generally twofold—for instance 25 frs. 20 c. to 25 frs. 25 c., meaning that the London banker would give the public an order on Paris for 25 frs. 20 c. for each sovereign he receives, or would give a sovereign for every 25 frs. 25 c. offered to him in the shape of a cheque on Paris.

He thus leaves a margin of profit of $2\frac{1}{2}$ centimes in each pound, either in buying or selling, the actual exchange being 25 frs. $22\frac{1}{2}$ c. This margin of profit pays for the trouble and outlay involved in the transaction, which the banker in London and his agent in Paris have to carry out.

It is necessary to point out that these quotations constantly fluctuate for various reasons, the principal cause being the balance of trade between different countries; let us cite an instance:

If operators in France sell in England goods or securities of a greater value than what English operators sell in France, the balance of trade is said to be against England; consequently the quotation in Paris for pounds sterling declines. There are, however, indirect influences on the exchanges between different countries; for example, England may owe money to the United States for wheat, cotton, or other commodities, while the United States may owe money to France for silk or wine. In that case the American merchant would probably send to France bills drawn on England against the goods which English merchants have bought from him. These bills being sold in Paris would tend to depress the quotation of pounds sterling in Paris, just as if England owed the money to France. We thus see that foreign exchanges play an important part in facilitating the settlement of debts due by one country to another, thus avoiding the cumbrous mode of paying international indebtedness by the transmission of specie.

Another cause of variation in foreign exchanges is the inequality of the value of money in different commercial centres; money, like water, finds its level, it flows, unless some obstacle intervenes, to those countries where a better rate exists, until it equalises those differences. Those obstacles are the question of credit, and of the dissimilarity in the respective currencies; where these things are equal, a difference in discount rates will attract or repel money from one country to another. For instance, when the Baring crisis occurred in November 1890, the Bank of England raised its rate of discount to 7 per cent., which rate was maintained for some time, and was higher than the value of money in other commercial centres. The effect was immediately apparent; all foreign merchants and bankers who had confidence in their London agents remitted money to obtain a higher rate of discount than what obtained in their respective countries. These remittances acted on the foreign exchanges, causing them to rise to the gold export point (see GOLD POINTS IN FOREIGN EXCHANGES), necessitating the shipment of gold to London.

Another effect of high discount rates is the depression in the value of merchandise and securities, such as bonds and shares held on borrowed money. These are sent to markets abroad where money is cheaper, and naturally money is sent to London in payment of the goods and securities received. Another cause of fluctuations in foreign exchange is internal disturbance, either social or financial, creating alarm and inducing the transference of money from one country to another for safe custody.

We have seen at intervals in Paris that disturbances have caused the exchange on London to advance very rapidly in consequence of large sums being sent to London for safe keeping.

The season when English people migrate to the Continent is generally marked by a decline in the value of sovereigns abroad, and the exchange is then said to move against this country. The quotation of exchange between countries using gold as the chief circulating medium can however only fluctuate between well-defined limits called the export or import gold points. Thus the exchange on London cannot for any length of time fall below 25 frs. 10 c., nor rise above 25 frs. 40 c.; because in the former case gold would be sent from London to Paris to purchase pounds sterling, and in the latter case the reverse operation would take place, and gold would be sent from Paris to London. The difference of 30 c. or 3d. per sovereign covers the freight and insurance, also the mint charges involved in converting the gold of one country into that of the other.

There is, however, considerable difficulty at times in fixing the exchange between this country and another which has a silver or paper currency. Sometimes the variations are great and rapid; sometimes it is difficult to fix a close ratio between buyers and sellers of exchange on countries having a basis of circulation different from our own. Let us take the exchange between this country and India, which is the largest silver-using country in the world. The exchange in London on India varies materially and suddenly. On some occasions there has been no reasonable quotation for bills on our great dependency, because of the uncertain value of silver. The rupee declined from the rate of 2s. $\frac{4}{4}$d. in 1864, to the rate of 1s. 2$\frac{5}{8}$d. in August 1892, and subsequently even lower. These enormous fluctuations arose from the variations in the gold price of silver in this country, but the fluctuations in the exchanges between India and other silver-using countries has been very slight.

Thus the exchange between Shanghai and Calcutta did not vary so much during the year 1891 as the quotation between London and Paris; in fact, the fluctuations between China and India seldom exceed $\frac{1}{2}$ per cent, which represents the cost of freight and insurance on transmitting silver between those countries.

The greatest variations, however, arise in the exchanges between this country and those where there has been a suspension of specie payments. The most notable instances are with Russia, Spain, and Portugal in Europe; and with Brazil, Chili, and Argentine in America. There is hardly a limit to the possible depreciation of a paper currency. We have noticed, with regard to Argentine, a premium on gold of 300 per cent, or a reduction in the value of paper to one-fourth of its former gold value.

All depends in these cases upon the quantity of paper money issued, relatively to demand and to the absorbing power of the country con-

cerned and upon the credit of the government which is responsible for the ultimate redemption of the paper currency. We know that almost every country has passed through this critical financial stage; even in this country, at the beginning of the 19th century, gold has been quoted at a premium of over 50 per cent, as against Bank of England notes. At such a time the foreign exchanges were greatly adverse to this country, and all gold was exported. Fifty years ago the United States had a similar experience of a forced paper currency with foreign exchanges all against that country, causing the exportation of gold and silver to pay for war stores. We thus see that foreign exchange acts like a barometer giving indications of the financial aspect in every country, acting as a warning when a financial storm is impending, counselling those who have too many engagements afloat to take in sail; while in fair weather it gives an assurance of smooth water ahead, administering a well-founded impetus to all who embark in legitimate enterprises.

[See Goschen, *Foreign Exchanges.*] S. M.

EXCHANGE, FOREIGN, practical working of. If it be sought to apply the theory of the foreign exchanges to practical ends, or to draw trustworthy conclusions from their fluctuations, the following axioms should be noted.

Firstly, the current rate of exchange is the price of a bill of exchange either at usance or at sight. It is not necessarily the ratio at which the money of one country exchanges for the money of another. At a time when *e.g.* a cheque on Berlin is to be bought at 20·40 marks to the £, it may be necessary to pay 20·20 for German gold coin (because it must be assumed that the seller has been at the expense of importing it); but 20·40 would be called the rate of exchange, not 20·20.

Secondly, the price of bills is governed by the ordinary laws of supply and demand. When they grow scarce they grow dear, when they become plentiful they become cheap. If they become very dear, the would-be purchasers look round to see whether there is anything else they can remit to better advantage—produce, let us say, or some particular stock exchange security, or one of the precious metals—and, as soon as they discover such an article, they cease buying bills, and the price stops rising; if they become very cheap, the would-be sellers consider whether it might not pay better to employ the money standing at their credit abroad in the purchase of something—gold, say, or a foreign bond—which is saleable at home, and immediately this becomes feasible they cease offering bills, and the price stops falling.

Thirdly, the rate of exchange at A for cheques on B must correspond, or tend to correspond, with the rate of exchange at B for cheques on A, assuming that credit has not been shaken on either side, and that there exists a free market for cheque and cable transfer. Otherwise exchange-dealers would secure a speedy and easy profit. Thus if Paris telephones "Cheque London 25·26" while here it stands at 25·24, bankers on both sides would instantly sell as much as possible, the result being as follows:—

London pays say £5000 (amount of the Paris draft), and receives £5000 (proceeds of its draft on Paris for fr.126,200 at 25·24).

Paris pays fr.126,200 (amount of the London draft), but receives fr.126,100, proceeds of its draft on London for £5000 at 25·26; showing without any outlay whatsoever, a gain of 100 francs. This is called arbitrage-business, and illustrates the manner in which the exchanges are actually regulated, for it is of course obvious that under the influence of such transactions the rates in Paris and London will very speedily be brought to a level.

Fourthly, as it is the custom of trade to give credit to the buyer who buys to sell again, most bills are drawn at a usance, varying from thirty days to six months, according to custom, and the usual exchange quotation applies to bills at usance. Between the exchange for a bill at sight and that for a bill at usance, the difference depends on the rate of interest prevailing in the place upon which it is drawn. The usance, for example, of bills on Italy is three months, and if interest in Italy rules at 4 per cent, a bill at usance should cost 1 per cent less than a bill at sight.

Fifthly, as the bills drawn on London from abroad vastly outnumber the bills drawn on abroad from London, the demand and supply of the former exercises a proportionately greater influence over the course of the exchange than that of the latter. In other words, the actual rise or fall takes place on the foreign market, and London in most instances merely adjusts its rates according to the quotations telegraphed from abroad.

Lastly, in those countries where the value of the currency oscillates in relation to gold, the exchange is subject to two sets of fluctuations—to fluctuations of limited extent caused by changes in the ratio of supply to demand, and to fluctuations of almost unlimited extent caused by changes in the value of the currency-medium. Thus, if the normal exchange with a paper currency country be 48d. per $ gold, or $5 to £1, a rise in the gold premium, which is illimitable, from 200 per cent to 300 per cent would cause the exchange to move from 16d. per $ paper, or $15 per £, to 12d. per $ paper, or $20 per £.

[See Lord Goschen, *Foreign Exchanges* (Effingham Wilson, 1863)—the classical work on this subject. For the calculations needed for "the solution of the problems encountered in the merchant's every-day experience," see especially the works of George Clare, *A B C of the Foreign*

Exchanges (Macmillan, 1895).—*A Money Market Primer* (Effingham Wilson, 1893).—H. Deutsch, *Arbitrage* (Eff. Wilson).—Ottomar Haupt, *Arbitrages et Parités*, 1894. Franklin Escher, special lecturer on Foreign Exchange at New York University, in *Elements of Foreign Exchange* (Eff. Wilson, 1910), gives an interesting explanation of the subject from the point of view of the United States.—Hartley Withers, *Money Changing*, 1913.] G. C.

EXCHANGE BETWEEN HOLLAND AND DUTCH INDIA. (The guilder converted in this statement as 12=£1.) To explain the working of the exchange between Holland and Dutch India, it is necessary to describe the different currency systems in force in the mother country and the dependency. To begin with that of Holland. At the commencement of the 19th century the state of the currency in the Netherlands was very unsatisfactory. From early times silver had been the only standard of value, but an almost unexampled variety of silver coin was in circulation, owing to the fact that, during the existence of the Republic of the United Netherlands, nearly every province had a separate mint. Gold coin had also been struck, and was a medium of exchange at rates officially fixed by the government; but silver alone was legal tender until the year 1816, when (Act of 28th September) dual legal tender was introduced at the ratio of 15·87, between the then current silver gilder of 200 aas weighing 9·61 grammes fine, and the ten guilder piece weighing 6·056 grammes fine gold.

Gold being thus over-valued, as compared with the bimetallic ratio of 15½ adopted by France in 1803, all the full weight silver coins were driven out of the country, and gold coin, struck according to the law of 1816, together with all the worn and clipped silver coin of earlier date, formed the only circulating medium.

To remedy this state of affairs it was enacted in 1839 (Act of 22nd March) that the historical guilder of the weight of 9·61 grammes fine silver should be reduced to the weight of 9·45 gram fine, thus raising the ratio from 15·87 to 15·60; but the clipping of the old coin continued on a most scandalous scale, so that often a premium of 5 to 7½ per cent had to be paid for full weight pieces. A thoroughly efficient reform of the currency became indispensable, and a general recoinage of all the old silver money, struck before 1839, was accordingly ordered by the Act of 22nd May 1845.

Within a couple of years a nominal amount of 85 millions of guilders old silver (£7,083,000) was withdrawn from circulation and converted into new coin, at a cost of some 8 millions (£666,600), the operation itself being to a great extent facilitated by the still existing double standard, gold coin being available for the use of the public in adequate quantities. At the same time, the question whether the double standard system could be continued, became a matter of ample discussion in the press, and after lengthened debates in parliament the law of 26th September 1847 was enacted, by which the monetary system of the Netherlands was based on the silver standard only, with the silver guilder of 10 grammes and $\frac{945}{1000}$ fine as the unit, all the gold coins in the hands of the public being withdrawn from circulation and demonetised.

This decision was taken when nothing yet had transpired about the Californian and Australian gold-fields. That only became known to the world a couple of years later; nothing, therefore, can be more erroneous than the assertion, often made, that the final adoption of the silver standard as basis of the monetary system of the Netherlands originated in the fear of a probable fall in the value of gold. The greater convenience of silver for domestic purposes was the principal motive for a reform which at that time perfectly answered the purpose.

The recoinage of the old silver coins being completed in 1849, a beginning was made in the following year by withdrawing the gold ten and five guilder pieces from circulation. Of these g. 172 millions (£14,333,300) had been coined and delivered to the public, but scarcely one-third of that amount, say g. 50 millions (£4,166,600) was presented for exchange against the state notes *muntbiljetten*). These notes were intended to be issued as a temporary medium of exchange only, but as the public became accustomed to them they proved so convenient that up to Oct. 1, 1904, they formed part of the currency of the country to a limited extent—varying between 10 millions (£833,300) originally and later 15 millions (£1,250,000).

All the gold coins received from the public were sold on government account at a loss of 1 million of guilders (£83,300), and altogether the reform of the currency, including the recoinage of the old silver money, and the demonetisation of the former gold coin, has been effected at a cost of about 10 millions (£833,300).

Since that date, 1847, the state of the currency became most satisfactory in every respect, and certainly no new reform would have been thought of if the monetary policy of the neighbouring countries had remained unaltered. But in 1872 the rulers of Germany deemed it advisable to introduce gold as the standard of the newly-constituted Empire, and it soon became evident that Holland could not remain indifferent to the intended reform of the German currency.

In October 1872, therefore, the Dutch government appointed a special commission to consider the subject and to advise as to the measures necessary in the interests of the country, and in December the commission re-

ported that it would be impossible for Holland to retain the silver standard established by the Act of November 1847, were all her neighbours to adopt gold as their standard of value. According to their views the most desirable solution of the question for Europe in general would be the adoption by the leading monetary powers of the double standard—admitting the free coinage of both gold and silver as legal tender at the same fixed ratio of value. They considered that a great stability of value for both metals would be the result of the compensatory action of that system, if introduced throughout the whole of Europe; that Holland alone would be powerless in the matter, and therefore that it would be indispensable for Holland to adopt the single gold standard should Germany decide upon that line of action, and that, in the meantime, without abrogating the law of 1847, the further coinage of silver on private account should at once be restricted or stopped altogether.

In conformity with the recommendation of the commission, the closing of the Utrecht mint for private coinage of silver was ordered by the law of 21st May 1873, and on Germany establishing the gold standard by the law of 9th July 1873, a bill was submitted to the states general, proposing the introduction of a legal tender currency of ten and five guilder pieces in gold, and the withdrawal from circulation of the silver standard coins issued under the currency regulations of 1847. The bill, however, was rejected; matters remained as they were until the middle of the year 1875, when, according to the law of 6th June, the mint was opened to the public for the coinage of ten guilder pieces of 6·048 grammes fine gold, to be legal tender concurrently with the silver guilder, the further coinage of which remained prohibited.

Thus the system of the *étalon boiteux* was introduced in the Netherlands, and, though it is of course open to the greatest objections, it must be acknowledged that, up to this moment, it has caused no serious inconvenience or mischief whatever. As a rule, the balance of trade is in favour of Holland, and bullion accordingly flows in freely. But occasionally the tide turns, as was the case in 1882, when a strong demand for export set in and the bank's stock of gold, which about the middle of 1880 had amounted to 80,000,000 of guilders (£6,666,600), decreased to below 5,000,000 (£416,600). The defect of the system then became evident. If once the gold stock of the country were exhausted, silver would become the regulator of the currency without any other limit to the depreciation of the currency and a corresponding rise in the foreign exchanges than the price of bar silver in the London market.

To protect the general interests of the country against the serious dangers eventually certain to result from such an unsettled state of affairs, a bill was passed (Act of 27th April 1884) empowering the government, as soon as the state of the currency should render it necessary, to withdraw from circulation, and to sell in the open market, silver coin to the amount of 25,000,000 of guilders (£2,083,300, at 12 gs. = £1) and to buy gold with the proceeds. Up to this moment, however (February 1911) there has never been any need to put this measure—which in the full sense of the term may be considered as the safety valve of the present currency system of Holland—into force. The law of 1884 is the unequivocal acknowledgment of the principle that the state is responsible for the maintenance of the gold value of the silver currency, and that it is one of the first duties of every government that has imposed a standard of value upon its subjects to take every reasonable precaution in its power to prevent that standard from fluctuating.

The currency system which has now been in force in Holland for about forty years, though defective in principle, has fully answered the requirements of the country, and it may remain unaltered for many years more unless it breaks down through the immense profit to be made by unscrupulous persons in manufacturing illicit coins of exactly the same weight and standard as the legal ones. But if this becomes the case, it will not only be Holland but nearly the whole continent that will have to face a difficulty of the greatest magnitude, the solution of which may make an international understanding with respect to money matters more urgent than ever.

Having thus described the system of currency in force in Holland, we will now turn to that of her Indian possessions.

In Dutch India the state of the currency was for many years even worse than it was in the mother country before the reform of 1847 was effected, and even the government itself was instrumental in wilfully perverting the currency of the colony.

The erroneous idea prevailed that the wants of the native population were on too limited a scale to require the precious metals for a general medium of exchange, and that it was in the interest of "the good people of these countries to increase the circulation of copper coin as much as possible" (*Decree of the Governor-General of Dutch India*, of 25th June 1818). Hence the government continued for years to effect the bulk of its payments in copper money, the so-called doits (*duiten*), which were imported in large quantities from Holland with the unavoidable result that all the good money formerly issued was driven out of the country. Silver was still the legal standard, and the silver guilder the unit of account, but virtually only copper remained as the general circulating medium for the whole community. A general depreciation of the currency was the natural consequence of this

state of affairs, a loss of 25 to 30 per cent having to be incurred on every remittance to Holland or elsewhere.

The colony suffered severely for many years under this miserable and scandalous condition of the currency. At last the government became aware that measures of a most stringent character ought to be taken to resettle currency matters on a satisfactory basis. By the law of 1st May 1854 the monetary system of the mother country, as regulated by the law of 1847, was introduced in Dutch India, and since that time nothing has been left undone by the authorities to secure the colony the benefit of a thoroughly efficient currency. For some consecutive years large shipments of silver coin from Holland to Java were made on government account, between 1854 and 1860, 90 millions of guilders (£7,500,000). Everywhere an opportunity was offered to exchange silver for the circulating copper money, and thus a long-wished-for reform was effected at a cost to the state of about 20 millions of guilders (£1,666,600).

Ever since that date the condition of the currency in Dutch India has been as satisfactory, nay as perfect, as in the mother country itself; even the late silver crisis leaving it altogether unaffected in consequence of the measures taken by the government to keep the currency at the standard value by closing the Utrecht mint, not only for the home, but also for the colonial coinage. Having no mint of its own, Dutch India has always been supplied with the money required for circulation by specie imports from Holland, the standard coin being exactly identical, and the stock of silver legal tender money available in Holland has till now been more than sufficient to meet the requirements of the circulation of the colony.

Thus a very close link exists between the currency of Dutch India and that of Holland. At first it was thought that silver might remain the standard in the eastern possessions of the kingdom, whatever reform might be introduced in the monetary system of the mother country; but gradually the conviction prevailed that, equally with the people of Holland, the Indian subjects were entitled to protection from the difficulties in which the action of a depreciating currency must necessarily involve them, and to remove all uncertainty as to the standard of value in the colony the law of 28th March 1877 decided that gold ten guilder pieces should from that date be legal tender in Dutch India,—thus establishing the monetary system of the colony on exactly the same basis as in Holland.

Meanwhile no gold whatever is to be found in circulation in Dutch India; but the lack of gold has never caused any inconvenience, and is in fact of no consequence so long as the circulating silver money fetches the full value of gold for payments in Holland. More than once Dutch India has had to face an unfavourable balance of trade, making the export of specie unavoidable (Table A), but the rate of exchange never exceeded the bullion point of gold (see GOLD POINTS IN FOREIGN EXCHANGES), since silver could always be used as a remittance to Holland in order to effect payments there, or to purchase sterling bills in Amsterdam for payments in England.

1908	102¼	101¼	102⅞	11·94	11·725	11·83

In consequence rates of exchange at Batavia —the financial centre of Dutch India—have maintained a most remarkable steadiness during the last forty years, as shown in table B, see page 775, to explain which it may be added that the way of quoting the rate of bills drawn on Amsterdam is exactly the reverse of the quotations for sterling paper. For the latter the Dutch Indian currency is the fluctuating term, the quotation consisting of a varying number of guilders and cents to be paid for the pound sterling. In the exchange between Batavia and Amsterdam, on the other hand, the latter place gives the "uncertain" a quotation of 101, meaning that g. 100 Dutch Indian currency gives claim to g. 101 Netherlands currency. Thus it is obvious that a rise in the quotation of bills on Amsterdam must correspond to a decline in sterling quotations. [See EXCHANGE, FOREIGN, practical working of.]

During the last forty years in drawing from Java the extreme rates for Dutch bills have been 99¼ and 104½, and for English bills g. 12·15 and g. 11·375, thus showing a fluctuation of only 5¼ per cent for the former, and 7 per cent for the latter bills. Since 1875, when the great fall in the price of bar silver set in, rates have not fluctuated more than 2½ or 3 per cent. Thus Dutch India has been spared the disturbance in money and exchange matters which has caused so much inconvenience and loss in British India.

By the law of December 31, 1903, renewing the charter of the Netherlands bank, power was granted it to issue notes of 10 guilders (16s. 8d.), and simultaneously the state notes were withdrawn from circulation. Since then the regulation of the fiduciary currency of Holland has remained in the hands of the bank under the regulations ordered by law.

[But the fact is not to be overlooked that the whole structure of the currency of Dutch India must collapse in case Holland is forced by circumstances to complete its monetary reform by the demonetisation of the silver actually circulating as full legal tender money. Then the colony would be obliged to follow, and it is therefore not at all impossible that at some future period even the Eastern Archipelago may appear in the market for the sale of silver and the purchase of gold, unless it may still be practicable to arrive at an international understanding about the free coinage of silver as proposed originally in the report of the Dutch currency commission of 1872.] N. P. v. d. B.

[Ratio of silver to gold in Holland, taking mint charges into account, 15·625 to 1.]

EXCHANGE BETWEEN GREAT BRITAIN AND BRITISH INDIA.—The drop in the value of silver, commencing after 1867 (see LATIN UNION), compelled the government of British India to make in 1893 an arrangement for its remittances between India and London, similar in many respects to that in existence between Holland and the Dutch Indies (see EXCHANGE BETWEEN HOLLAND AND DUTCH INDIA). The rate at which council bills were issued in London was separated from the price of silver. In order to effect this, the coinage of rupees in India on private account was suspended, with a view to the introduction of a gold standard. The Indian government had been anxious that this step should be taken; but the home government desired that a thorough examination into the whole matter should be previously made. A departmental committee was appointed, consisting of Lord Herschell, afterwards lord chancellor, chairman, other members being Mr. Leonard, now Lord, Courtney, Sir Thomas afterwards Lord, Farrer, Sir Reginald, now Lord, Welby of the treasury, Mr. Arthur Godley, now Lord Kilbracken, of the India office, Sir Richard Strachey, and the late Mr. B. W. Currie, who was a member of the council of India and of the firm of Glyn and Co. The committee considered the proposals of the Indian government, which aimed at fixing the exchange at the rate of 1s. 6d. per rupee. This rate the committee did not adopt; the market rate being at the time (June 1893) approximating to 1s. 2d. for the rupee. The general conclusions of the committee, in their report to the secretary of state for India, Lord Kimberley, were that "while conscious of the gravity of the suggestion, we cannot, in view of the serious evils with which the government of India may at any time be confronted if matters are left as they are, advise your lordship to over-rule the proposal for the closing of the mints and the adoption of a gold standard, which that government, with their responsibility and deep interest in the success of the measures suggested, have submitted to you. But we consider that the following modification of these proposals are advisable:—The closing of the mints against the free coinage of silver should be accompanied by an announcement that though closed to the public, they will be used by the government for the coinage of rupees in exchange for gold, at a ratio to be then fixed, say 1s. 4d. per rupee; and that in the government treasuries gold will be received in satisfaction of public dues at the same ratio." The Indian government acted immediately on this recommendation, and an act was passed in the council at Calcutta (June 1893) carrying the report of the committee into effect, and fixing the rate at 1s. 4d.

The action of the government in 1893 was immediately followed by a rise in the selling rate of India council bills in London from about 1s. 2d. to 1s. 4d. for the rupee, and by a rather more than corresponding fall in the market price of silver. Suggestions have been made to bring the rate for council bills upwards to 1s. 6d., and ultimately to about 2s. for the rupee. It remains to be seen whether the Indian government will have sufficient control over the market for bills to enable it to carry

this into effect. Nor can the influence on the coinage legislation of other countries—as for example on the United States of America—or on the rate of exchange in the trade with other silver-using countries be stated at present, or the effect which may be produced on the trade of British India, or on the condition of the people. One result, if the measure continues to operate, will be the formation of the largest "token" circulation of coins that has been known in modern times, as the rupee will circulate at the rate which the government fixes it at relatively to gold, irrespective of the gold price of uncoined silver; while for the present, at all events, there is no gold coin current to represent the rupee. A further result will be the entire separation of the rate for the bills on India from the market value of the ordinary circulation of the country. The council bills are, as was desired, issued at the rate fixed for the time by the Indian government. The arrangements, in so far as they are based on an authoritative rate fixed by a government for monetary transactions, and a fixed ratio between gold and silver are similar in some points to those on which bi-metallic systems have been founded; but while this is the case, the leading principle of bi-metallism, namely, the power of the subject to have his bar silver or bar gold coined into money and to be able to pay his debts with either metal so coined, is entirely absent. The success of the plan depends solely on the power which the Indian Council may be able to exert over the London market. The Indian Coinage Acts of 1899 and 1906 enacted that "gold coins, whether coined at Her Majesty's Royal Mint in England, or at any mint established in pursuance of a proclamation of Her Majesty as a branch of Her Majesty's Royal Mint, shall be a legal tender in payment or on account at the rate of fifteen rupees for one sovereign." No such gold coins have yet (1914) been struck at any mint in India.

No reference has been made in this statement to other points, many of great weight, connected with this question, such as the possibility of private coinage — in the vast region of India, much of which is not under the control of our government—of spurious silver rupees equally valuable with those issued by authority, an operation which would be very profitable to the coiner (this, however, up to the present, 1914, does not appear to have been carried on to any very large extent)—of the effect on the Indian cultivator of the soil, who will now be deprived of the resource which silver, in the form of ornaments, has been to him in time of famine—or of the result on the trade of other silver-using countries.

The measure was designed to prevent the rate from dropping lower, but it will have the effect of stereotyping the loss entailed by the fall in exchange both on the government and on private individuals at the point at present fixed.

[See *Report of the Committee appointed to inquire into the Indian Currency*, 1893.—*Correspondence between the Government of India and the Secretary of State*, 1893. Comp. *Econ. Journal*, Sept. 1893.]

[Ratio of silver to gold in India, with rupee at 1s. 4d., taking mint charge into acct., 22·37 to 1.]

EXCHANGE, INTERNAL. One factor in the calculation of all exchanges is the cost of the transmission of bullion, including therein the cost of actual transport and the risk and trouble involved. In the foreign exchanges these charges are in a general way concealed by the fact that the two sides are in terms of different currencies; and they are modified by the competition of bills of exchange, according to the supply and demand of which will be the proportion of such charges which a remitter will have to bear. The same expenses attach to the settlement of transactions between different parts of the same country, but they are rendered more apparent by being expressed in the form of a commission or premium. They are also usually more uniform, as they are not affected by momentary competition, but are governed by the condition of the banking system, tending gradually to diminish in proportion to the completeness of its development.

In this country the facilities for internal exchange are considerable, and its cost has been brought to a low point. The post-office system of money orders, and of postal notes and orders, furnishes the means of remitting small sums to almost every village, at a cost that has continually decreased as the facilities offered have increased. In the first quarter of the 19th century remittances could only be made to a few towns, and at a cost of about $2\frac{1}{2}$ per cent. At the present time the number of points to, or from, which remittances may be made has risen to upwards of 10,000, whilst the cost may not much exceed one-half per cent. For larger sums remittances were formerly made by bankers' drafts, or bank post bills, the charges on which were defrayed partly by a direct commission, and partly by deferred payment. At the present time, by means of the country cheque clearing (see CLEARING SYSTEM), remittance may be made throughout the whole of England and Wales absolutely without cost, whilst for the collection of drafts other than cheques, and for all collections in Scotland and Ireland, the cost has been brought generally to about $\frac{1}{20}$ of 1 per cent. This result is greatly due to the spread of branch banking (see BANKS, ENGLAND AND WALES).

In the United States the development of the national banking system (see BANKS, NATIONAL, U.S.A.) has led to remarkable results in the same direction. This system was established in 1865, at which time the cost of southern and western exchange on New York was from 1 to

1½ per cent, and even for different parts of the state of New York it was ½ per cent. The difficulty of obtaining reliable remittances was even more serious than its cost, as the notes or drafts of banks in any state were frequently quite useless but a few miles beyond its borders. By 1890 the rates of commission or premium, on internal exchange, had so far declined that they ranged from 1 cent per $100 ($\frac{1}{100}$ of 1 per cent) in some small states, as Rhode Island and New Hampshire, up to 21 cents per $100 ($\frac{1}{5}$ of 1 per cent), in Nevada, Texas, and some other states. The influence of the Bank Act of 1913 on internal exchange remains to be seen.

In France the Bank of France, through its numerous branches, has long afforded considerable facilities for internal exchange, which have increased in recent years by the still more numerous branches of other banks. R. W. B.

EXCHANGE OF NOTES (in reference to the note circulation in Scotland). All the banks now (1914) carrying on business in Scotland are banks of issue. They are nine in number, and there is a stringent system maintained of exchange of notes once a day in every town in which there are two or more banks. In the case of a bank holding the notes of another bank not represented in its town, these are remitted to the issuing banks at short intervals. On Saturdays there is an afternoon as well as a morning exchange, so that the returns of circulation made at the close of business on Saturdays, as required by the terms of the Bank Act of 1845, exhibit the amount of notes then in active circulation, *i.e.* in the pockets and tills of the people. No bank ever issues the notes of any one of the other banks.

The notes are, by the system described above, "cleared" to a great extent independently of the ordinary settlement of drafts and bills between the banks. The system is a very convenient one, and saves the banks concerned a great deal of labour.

All clearing-house balances, other than those arising at the Edinburgh clearing-house, are settled by drafts on Edinburgh, which pass through the clearing-house there, and the balances of the Edinburgh clearing-house are settled bi-weekly by transfers of cash made in London four days later. Interest at 3 per cent is paid by the debtor banks on balances until the date of final settlement in London.

EXCHANGE BROKER. Unlike the bill-broker (see BILL-BROKING), who in most cases is really a *dealer* in bills, which he buys and sells for his own account, the exchange or *foreign bill* broker is strictly what the title of his calling implies, namely, an intermediary or negotiator between the buyers and sellers of bills of exchange drawn on foreign countries.

Such bills fall into two classes; those drawn from the provinces, and those drawn from, or held in, London. As regards the former, all practically pass through the country banker into the hands of his London agent for negotiation, and, as the latter does not attend 'Change, they are, without exception, sold through brokers. In the case, however, of London-drawn paper, or of such as is remitted to London houses, the seller is quite at liberty, if he so chooses, to go on 'Change and save the brokerage by offering the bill for sale himself; but he usually finds it to his advantage to employ a skilled agent.

The exchange broker must be sufficiently familiar with foreign law and custom to be able to point out and explain any irregularity of form, stamp, or endorsement, etc., in the bills that pass through his hands. He ought also to be competent, besides knowing the present state of the exchange, to form an opinion as to its probable course, in order to advise his client, if need be, when best to buy or sell. He is also expected, when executing a buying order, to protect his client's interest by exercising a due regard to the financial and moral standing of the parties to the bill.

On concluding a bargain, the broker makes it legally binding by passing a contract note to both parties, giving particulars of the bill and specifying the rate at which it has been sold. In the buyer's copy he also fills in the name of the party who has to deliver, and in the seller's that of the party who has to receive and pay. Payment, it may be added, is not effected through the broker, as in stock exchange transactions, but the principals settle direct on the following day. The charge for brokerage is nominally one per mille (2s. per cent), but is subject to modification. Brokerage accounts are rendered once a year.

The growing tendency to effect settlements by bill on London, instead of by bills drawn from England on abroad, is strikingly illustrated by the fact that, notwithstanding the enormous increase in our foreign trade in the last half-century, the number of exchange brokers has only risen, according to the Post-Office Directory, from 13 in 1841 to 15 in 1911, as against an increase during that period in the number of London stock brokers from 343 to upwards of 5000, with over 2300 clerks besides. G. C.

EXCHANGER, ROYAL. The chief functions of the king's or royal exchanger were as follows: to buy bullion for coin save where private mints existed, to exchange current coin of one metal or denomination for that of others, and to exchange foreign and English coins.

In the reign of Henry I. we find this office and that of moneyer united and vested in one person. But this union did not continue. Succeeding kings separated the office of exchanger and developed its constitution. Thus Edward I. had tables of Exchange set up in various places, as York, Dover, Canterbury, etc. In addition to the other and more ordinary ser-

vices which he performed, the exchanger and his subordinates were entrusted with the important duty of so discharging his office that the export of precious metals from the country might be prevented. He continued a royal functionary and in discharge of his duties till the reign of Henry VIII. Then the complaints of the goldsmiths and the advice of Sir Thomas Gresham were listened to, and in 1539 the office of the royal exchanger was abrogated on the ground that its charges and action impeded traffic. Despite a nominal restoration in 1546, the previous date may be regarded as marking the termination of this restraint on the exchange. Statesmen and theorists were, however, very much divided as to the expediency of this action, and the protests against the extinction of the office proceed from well-known men, as for instance, Sir Robert Cotton.

Its reconstitution was mooted at the very beginning of the reign of Charles I. (in 1626). The goldsmiths were heard in opposition in the privy council, but did not prevail. On 25th May 1627 the revival of the exchanger was announced, and the king appointed "Henry, Earl of Holland, and his deputies, to have the office of our changes, exchanges, and outchanges, whatsoever, in England, Wales, and Ireland," for a period of thirty-one years. The goldsmiths petitioned, and the House of Commons protested against this reconstituted office. The Earl of Holland offering to submit his office to the judgment of the latter body, a debate took place, and it was agreed that it was a "grievance." No steps seem to have been taken to exercise any jurisdiction, and no attempt was made subsequently to revive this ancient office.

EXCHEQUER.

Exchequer, Early History of, p. 779; Exchequer, present constitution of, p. 781; Exchequer, Scotland, p. 784; Exchequer Bill, p. 784; Exchequer Bill, History of, p. 784; Exchequer Bond, p. 785; Exchequer Bond, History of, p. 785; Exchequer, Closing of, 1672, p. 786.

EXCHEQUER, EARLY HISTORY OF. The Exchequer, *i.e.* the department of government which superintended and managed the king's revenues, and into which all dues were paid, appears as an organised part of the state system in Norman times. In Early English times there seems to have been a treasury, sometimes at Winchester, sometimes at Westminster, while a hoard was kept in the king's chamber, and local treasuries were found in some provincial towns (Hall, *Antiquities of the Exchequer*, p. 3), but there are no traces of a court of account so early. Richard, Bishop of London, the treasurer, son of Bishop Nigel of Ely, and our chief authority for the early history of the exchequer, writing in 1178 (Liebermann, p. 11), states that it dates from the Norman Conquest, the arrangement being taken from the exchequer across the seas (*Dialogus de Scaccario*, i. iv.). Though this fact of a Norman origin for the English exchequer cannot be proved, it is probable that both came into existence about the same time; even if entirely independent, the English exchequer is certainly not much older than the Norman; while on the other hand, some of its peculiarities, such as the "blanch farm," show that the system was not borrowed in its entirety from Normandy.

In Henry I.'s time it is found as a distinctly organised department and as a court of law under the name "scaccarium," a name derived from the chequered cloth which covered the table at which the accounts were made up. All the financial business of the crown was carried on at the exchequer, and as in early times the regulation of finance and the administration of justice were intimately connected, much judicial work fell for a while under its control, until, with the elaboration of the judicial system, new courts arose, and until its authority was restrained by Magna Carta, by the statute of Rutland (12 Edw. I.) and by other statutes, to cases which directly affected the revenue. This close connection between justice and finance is indicated by the fact that the officials who sat as *justitiarii* in the curia regis, the supreme judicial court, sat also in the exchequer as *barones scaccarii*. These were the great officers of the household and others specially named by the king, presided over by the king or by his representative, the chief justiciar, until the final disappearance of that official in Henry III.'s reign, when the treasurer, always an important functionary, took the foremost place. The treasurer, who was assisted in the performance of his duties by the chamberlains, had indeed the superintendence of every department, and was responsible for the compilation of the great roll, the annual record of the crown dues, while he also gave directions for the execution of the royal writs. The chancellor, the representative of the equitable jurisdiction, acted as nominal guardian of the great seal, and also as a check upon the treasurer, whose roll was copied by one of the chancellor's clerks. The constable, with clerical assistance, made payments to the royal officers and others upon receipt of the king's writ, for without such a warrant the issue of money was strictly forbidden. To cut the tallies (see TALLIES), used as receipts, a cutter of the tallies was employed. Under these more important dignitaries were a large body of officials, sitting in the lower chamber, who prepared the summonses and other business, and acted as fiscal experts. Some of these offices were held in fee, and mention is found of a woman hold

ing office as chamberlain and acting by deputy (Hall, p. 82).

Full sessions of the exchequer were held at Easter and at Michaelmas, generally at Westminster, although instances of its session elsewhere are found as late as the reign of Edward II. (Madox, ii. p. 7). Other sessions were held during the Hilary and Trinity terms, and whenever it was deemed necessary, not excepting Sunday (Thomas, p. 7).

Manifold were the duties of the officials in connection with the revenue; not only did they receive payments from the sheriffs and others responsible for debts to the crown after careful examination of the accounts, but they also directed payments to be made to meet the royal requirements, and met administrative expenses of all kinds.

Business was carried on in two departments.

(1) The upper chamber, known as the exchequer of account (*scaccarium majus*), where the reports of the sheriffs and of others were received, and where all legal negotiations were carried on.

(2) The lower chamber or exchequer of receipt (*scaccarium inferius*) where the money was paid down, weighed, and tested, and from whence it was issued when necessary. The proceedings in the case of a sheriff, the most important of all accountants, may be taken as typical of the method adopted in transactions with the customers, escheators, bailiffs, and others responsible for the collection of the revenue.

At Easter the sheriff having received a summons and a statement of the items for which he had to account, appeared in person at the exchequer, unless excused for special reasons, when an attorney of suitable rank might act as his representative. The view of his account was then taken, and a proffer was made by him, being generally an instalment of half the total amount for which he was responsible. In return he received a receipt, known as a *tally*, the counterfoil of which was retained at the exchequer. When summoned to the Michaelmas session, the sheriff was required to answer for the full annual dues "in money or in tallies"; he then presented the tally or the voucher which represented such payments or allowances as might already have been made, together with the remainder still due in cash, and received full quittance of his obligations. A simple expedient for balancing the liabilities and the actual payments of the sheriff was devised by means of counters placed upon the squares of the chequered table, those on the one side of the table representing the value of the tallies, warrants, and specie presented by the sheriff, and those on the other the amount for which he was liable, so that it was easy at a glance to see whether the sheriff had met his obligations or not. In Tudor times "pen and ink dots" took the place of counters, and are found in use for the last time in 1676 (Hall, *Antiquities of the Exchequer*, p. 131).

Depreciation of the coinage through wear and the possibility of fraud led in early times to the adoption of precautionary measures. Thus when money was paid by tale a payment of sixpence on every pound was added to make good any possible deficiency; this was found to be inadequate, and in place of such a payment *ad scalam*, a payment *per pensum* was demanded, by which any deficiency in the actual weight had to be made up, or a composition of one shilling in the pound was exacted. In some cases the coin was submitted to a smelting test; this was generally done with the farm of the county, which was said to be blanched or dealbated, when such a test or a composition in lieu of it had been accepted. A regular staff of officials was employed in the exchequer of receipt to see that *real combustion*, *i.e.* the actual testing of bullion, or *nominal combustion*, *i.e.* the additional payment offered as a substitute, was not evaded by the king's debtors (see ASSAY).

Among the important records bearing on the work of this department, and carefully guarded by successive generations of officials, in hampers and chests, were the Domesday book, the most ancient record of the liabilities of crown tenants, the Red and Black Books of the exchequer, and other similar compilations; the most important for centuries was the great roll of the exchequer, commonly known as the Pipe Roll or *Rotulus Annalis*, the official register of all debts due to the crown arranged under the heads of counties, drawn up annually under the superintendence of the treasurer, and which served as the supreme authority by which the sheriffs and other accountants were judged. The first of these rolls still extant is that for 31 Henry I. (1130), but from the second year of Henry II. the series is complete. A duplicate of this roll was prepared for the chancellor, who closely checked any error on the part of the treasurer, while at the date of the compilation of the dialogus a third roll was transcribed for the king (*Dialogus*, I. vi.). In later times with the expansion of royal revenue a number of other rolls dealing with special parts of it became necessary (Thomas, *Ancient Exchequer*, p. 68). As attendance on the king and their duties in the various courts prevented the great officials from regular attendance at the exchequer, and as the sources from which the revenue was derived changed, various new officers were appointed to meet the demands in different directions. Thus as the chancellor and his subordinates became engrossed by the business of the chancery, their places were taken by the comptroller of the pipe and the chancellor of the exchequer (Thomas, p. 100), the latter official being often mentioned from the reign of Henry III. onwards, when the remembrancer

is also first heard of, keeping the memoranda roll, upon which were entered points left for consideration until the close of the audit, and acting in the capacity of solicitor to the treasury (see PIPE ROLLS). Towards the end of Elizabeth's reign the number of officials reached its highest point, and it is also noticeable as the time when the lord high treasurer, as he was now called, began to act less frequently in person at the exchequer and more by means of written instructions, and this gradually led to a new system for the conduct of business (Thomas, p. 21). Upon the death of the Earl of Salisbury in 1612 the treasury was for the first time put in commission, and since verbal orders could not be accepted at the exchequer from several persons, written instructions became a necessity, and led to the use of treasury warrants, which again paved the way for the modern department of the treasury. There is evidence that the lord high treasurer still acted in person until the removal of the exchequer to Oxford in 1643. Finance under the commonwealth was managed by committees of revenue until Cromwell revived the exchequer in 1654, and put the treasury in commission, which has been its normal condition since that time. During the Great Fire of 1666 the exchequer was moved for a while to Nonsuch (Hall, 76). In the course of George III.'s reign many of the old offices were gradually swept away, until in 1833 the ancient account and receipt departments of the exchequer were entirely abolished (3 & 4 Will. IV. c. 99; and 4 Will. IV. c. 15), the office of king's remembrancer being the sole relic to-day of the early system, for the work of the exchequer is now undertaken by the modern departments of the paymaster-general and the treasury, while the Bank of England has taken the place of the old exchequer of receipt. See BUDGET; EXCHEQUER, PRESENT CONSTITUTION OF; JEWS, ECONOMIC INFLUENCE OF (for exchequer of the Jews); PIPE ROLLS; TALLIES; TREASURY.

EXCHEQUER, PRESENT CONSTITUTION OF. The Exchequer is the national purse or receptacle into which (*a*) all the public revenues are paid, and out of which (*b*) all public expenditure is defrayed. The moneys paid into the exchequer constitute in the aggregate the consolidated fund of the United Kingdom (see CONSOLIDATED FUND), of which the local situation or receptacle is in practice at the Banks of England and Ireland, where all such moneys are carried to a general account, operated upon by the commissioners of the treasury, and known as the "Consolidated Fund Account," or Exchequer Account.

a. The following is the machinery by which the exchequer is supplied, viz.:

In the fiscal system of the United Kingdom the financial year does not coincide with the calendar year, but is reckoned from the 1st of April to the 31st of March. Towards the close of one financial year or beginning of the next—that is to say, in the month of March or April—the chancellor of the exchequer lays before the House of Commons his budget (see BUDGET), which is a statement of the revenue and expenditure of the outgoing, and the estimated revenue and expenditure of the incoming, year. He first estimates the revenue of the incoming year on the assumption that the existing scheme of taxation will be continued unaltered by parliament. If he considers that on this basis the revenue of the year will exceed the expenditure, he generally proposes to abolish or reduce certain taxes; if the contrary, to raise, increase, or extend them. It is not necessary that the scheme of the chancellor of the exchequer, so far as the revenue which he anticipates is founded upon the existing basis of taxation, should be sanctioned as a whole by parliament; for, in the absence of an enactment to the contrary, all taxes and imposts go on from year to year without express legislative renewal, except the tea-duty and the income-tax. If, therefore, the House of Commons approves of the budget proposals, all that is necessary, in the first instance, is that it should, by resolutions passed in committee of ways and means, sanction the levy of tea-duty and income-tax during the financial year, at the old rates, or at new rates proposed by the chancellor of the exchequer, as the case may be; and that it should also sanction by similar resolutions any changes which he proposes in other duties or taxes. These resolutions are subsequently confirmed, as soon as the exigencies of parliamentary business will allow, by acts of parliament prepared for the purpose, which are now called Finance Acts. At this stage the arrangements for supplying the exchequer with the necessary revenue during the financial year are formally complete. The commissioners of customs and excise and of inland revenue, acting under the directions of the commissioners of the treasury, levy the duties and taxes prescribed by statute; the post office continues from

year to year its profitable labours; and the moneys derived from these several sources are, together with the hereditary revenues of the crown, and certain other miscellaneous items, paid in by their collectors as they accrue to the exchequer account at the Banks of England and Ireland.

b. Such is the manner in which the exchequer is filled. It is now necessary to explain the procedure by which its treasures are disbursed. From the foregoing account it will be seen that the levying of the national revenue is completely under the control of parliament. The control of parliament over the national expenditure—or, in other words, over the disbursements of the exchequer—is no less, in fact if anything it is more complete. The expenditure of any given year is divided into two classes. 1. The first consists of charges, more or less permanent in their nature, which are authorised by act of parliament either for a given period or until the act authorising them has been repealed. These charges therefore do not form the subject of an annual vote of parliament, but are paid as they fall due under the authority of the act which grants them. They are called fixed charges on the CONSOLIDATED FUND (*q.v.*), and comprise the interest, sinking fund, and cost of management of the public debt; the civil list, or dotation of the crown; the allowances to members of the royal family; certain pensions granted for public services; the salaries of the judges; and of certain high officers whose independence is thought to be better guaranteed by permanent grant than by annual vote. In the finance accounts of the United Kingdom for 1912-13 the sums issued from the exchequer for fixed charges on the consolidated fund amounted to £24,500,000, or rather less than one-seventh of the total expenditure. In addition to those charges there were payments to local taxation accounts, etc., amounting to £9,653,000 assigned by various acts to local purposes. 2. The ordinary charges of the military, naval, and civil government, and of collecting the revenue, form the second class of public expenditure. They are annually granted by parliament, and as they are voted by the House of Commons in committee of supply, they are called the supply services (see SUPPLY, PARLIAMENTARY). The amount issued from the exchequer in 1912-13 on account of expenditure on the supply services is returned at £151,604,000, being nearly five-sixths of the total expenditure of the year.

Money to defray a fixed charge on the consolidated fund is taken out of the exchequer under the authority of the special act of parliament which fixes the charges. The following is the machinery by which money for supply services is obtained.

The government submits to the House of Commons estimates of the sums which it requires, under the several heads or denominations of service, known as votes (as the House of Commons votes them). Each of these votes is discussed at such length as the House thinks proper, and any item in a vote can be rejected, but the House cannot add a penny to a vote, it being a constitutional maxim that expenditure can only be voted on the recommendation of the crown. Nor has the House of Lords any share in the matter. It is a co-ordinate branch of the legislature; but the privilege of voting the money of the subject is exclusively reserved to the representative chamber.

Suppose now that the House of Commons has voted the proposed expenditure. This alone would not enable the government to act; for, although the exchequer is being daily filled with the produce of taxes, it cannot be availed of without further parliamentary authority for defraying the expenditure which the House of Commons has sanctioned.

The House of Commons alone criticises and sanctions the proposed expenditure, but the doors of the exchequer cannot be unlocked without the authority of an act of parliament. Accordingly, acts are passed from time to time, each parliamentary session, authorising certain sums to be taken out of the exchequer to defray expenditure sanctioned up to date. These acts are often referred to as "ways and means acts." Their parliamentary title is "consolidated fund acts," and the language in which they are couched is instructive, as summarising the procedure of parliamentary supply, viz.:—"Most Gracious Sovereign.—We, your Majesty's most dutiful and loyal subjects, the Commons of the United Kingdom of Great Britain and Ireland, in Parliament assembled, towards making good the supply which we have cheerfully granted to your Majesty in this Session of Parliament, have resolved to grant unto your Majesty the sums hereinafter mentioned, and do therefore most humbly beseech your Majesty that it may be enacted, and be it enacted by the King's Most Excellent Majesty, etc., etc." (Then follow, after the usual preamble of an act of parliament, provisions authorising the treasury to issue certain sums out of the exchequer.) Thus the House of Commons *grants* the money; but the three estates of the realm conjointly authorise, by statute, the taking of money out of the exchequer. In the parliamentary session of 1910 three such Consolidated Fund Acts were passed (10 Edw. 7, c. 4; 1 Geo. 5, c. 9; 10 Edw. 7 and 1 Geo. 5, c. 14). The last of these acts passed each session is called the "Appropriation Act"; it sets out in detail all the votes which the House of Commons has sanctioned in supply, and applies to them, and to them only, the required sums of money out of the exchequer, thus strengthening parliamentary control over administration by making it illegal for the executive to expend upon one service

money which has been voted for another. This practice of *appropriating the supplies*, as it is called, dates from the Revolution of 1688.

Thus it will be seen that the control of parliament over the exchequer is complete. A fixed charge on the consolidated fund can only be paid on the authority of a special act of parliament, and a supply service can only be paid after it has been voted by the House of Commons in committee of supply, and after the disbursement of the necessary funds has been authorised by a consolidated fund act or by a ways and means act. The practical security that these conditions are observed and that ministers do not take money from the exchequer for purposes which parliament has not approved is that money is only issued out of the exchequer with the permission of an independent officer appointed under the Exchequer and Audit Departments Act, 1866 (29 & 30 Vict. c. 39), and styled the comptroller and auditor-general, over whom the executive government has no control, and who guards the exchequer on behalf of parliament. Before any money can be issued from the exchequer the treasury has to requisition and obtain from that officer a credit or credits on the Exchequer accounts at the Bank of England and Bank of Ireland, and such credits are only granted if he has satisfied himself that the demand is for a service authorised by parliament. Then parliament provides against ministers obtaining money from the exchequer for a purpose which parliament has authorised, but spending it otherwise, by the fact that every department to which public money is issued is obliged, under the Exchequer and Audit Act (29 & 30 Vict. c. 39), to render an account of the disposal of such money to the officer above mentioned, the comptroller of the exchequer, etc.

It will here be proper to say a word as to the difference between the "committee of supply" and "committee of ways and means" in relation to public finance. In committee of supply the House of Commons determine how much money government shall be allowed to spend; in committee of ways and means it considers where the money thus authorised to spend is to come from. "The committee of supply considers what specific grants of money shall be voted as supplies demanded by the crown for the service of the current year, and explained by the estimates and accounts prepared by the executive government, and referred by the House to the committee. The committee of ways and means determines in what manner the necessary funds shall be raised to meet the grants which are voted by the committee of supply, and which are otherwise required for the public service. The former committee controls the public expenditure, the latter provides the public income. The one authorises the payment of money, the other sanctions the imposition of taxes and the application of public revenue not otherwise applicable to the service of the year" (May's *Parliamentary Practice*, p. 616, ed. 1879).

The grants which have been described are made by parliament to the crown, and the sovereign, by royal order, places them at the disposal of his finance department, the treasury. The treasury from time to time, as money is wanted, issues out of the exchequer to the accounts of the paymaster-general or the Revenue Departments, as the case may be, such sums as may be required to meet the expenditure of the various services.

Careful distinction must be drawn between the exchequer and the treasury. The exchequer is the national purse, the treasury is the finance department of the state, which controls the exchequer, on behalf of the executive government, subject to the check and audit of the comptroller and auditor-general acting on behalf of parliament. The treasury is governed by a board of commissioners, of whom the chancellor of the exchequer is one. The treasury, through the chancellor of the exchequer, moves parliament at the commencement of the financial year to provide the means of carrying on the government. It is to the account of the treasury, the exchequer account, that all public moneys are paid into the banks of England and Ireland, and it is the treasury again which when the supplies granted to the crown by parliament have been placed by the sovereign at the disposal of her finance department, the treasury, supervises and controls the expenditure of such supplies throughout every branch of the public service. The duties of the treasury, as the department responsible for the administration of the exchequer, are thus summarised by Mr. H. D. Traill in his *Central Government* (English Citizen Series, 1881), viz. :—

1. To provide the means of meeting the necessary yearly expenditure on the military, naval, and civil services of the nation.

2. To exercise a general control and supervision over the amount and details of that expenditure.

3. To revise and regulate the internal or domestic expenditure of the other public offices of the state, and generally to exercise such a superintendent authority over the financial management of such offices as is implied in these revisory and regulative powers.

4. To decide upon appeals from its own subordinate departments in all cases arising out of the receipt of revenue, and

5. To determine as to the remission of fines and forfeitures due to the crown.

The board of treasury consists of five commissioners, namely: the first commissioner or first lord of the treasury, an office which is generally held by the prime minister; the

chancellor of the exchequer; and three other commissioners, known as junior lords of the treasury. The financial powers of the treasury are in effect centred in the chancellor of the exchequer, who may therefore be described as the finance minister of the United Kingdom.

EXCHEQUER (SCOTLAND); originally a department or committee of the Scottish parliament, by the Treaty of Union, Art. 19, this court was to continue until a new revenue court should be established in Scotland. By 6 Anne c. 26, a new exchequer court was established in Scotland on the English model, the judges being the lord high treasurer of Great Britain, the lord chief baron, and four barons of exchequer. It was an attempt to establish a common judicatory for England and Scotland, and all members of the English or Scottish bars were entitled to plead before it, and the privileges of senators of the Scottish college of justice were conferred on the barons. It had exclusive jurisdiction over customs, excise, and other revenues of the crown, and all honours and estates accruing to the crown, and the gift of the office of tutor dative, or guardian appointed by the court. English forms of procedure were to be used. Other powers were the passing of sheriffs' accounts, superintending the administration of the sovereign's feudal superiorities, dues, and fines of crown vassals, etc. By 3 Will. IV. c. 13, all powers of this court bearing on revenue were transferred to commissioners of the treasury in London, but its legal jurisdiction was preserved. Other statutes modified and altered the court. Finally by the court of exchequer, Art. 1856 (19 & 20 Vict. c. 56) it was abolished as a separate court and all its former jurisdiction was transferred to the court of session, becoming the revenue department of that court. The English forms and terms were assimilated to those of the court of session, and one of the lords ordinary to be named by the crown was to act in exchequer causes.

[Clerk and Scrope's *Historical View of the Court of Exchequer in Scotland;* and Mackay's *Practice*, vol. i. 43, 192.] J. W. B. I.

EXCHEQUER BILL. This is one of the securities on which the British exchequer formerly raised money for temporary purposes. (See EXCHEQUER BILL, HISTORY OF.) The bills bore a fixed rate of interest, not above 5½ or below 2 per cent, and were a favourite security with bankers, merchants, and others, who required a good security for a short period.

EXCHEQUER BILL, HISTORY OF. Exchequer bills were a form of security on which the government, under the authority of parliament, might borrow money for the service of the state. They have been in use since the year 1696, and had their origin in the scarcity of the circulating medium during the great recoinage at that time. Their invention as a substitute for "money" is attributed to Charles Montague, the chancellor of the exchequer in William the Third's reign, and may be said to have been the first introduction of a paper currency organised by the state.

The first exchequer bills were issued under the authority of 7 Will. III. c. 31, and were to "pass in payments from any person or persons to any other person or persons that shall be willing to accept and take the same." They were made out in sums as low as £5 and £10, and were to bear a daily interest not exceeding 3d. per cent per diem. The object of the inventor of these bills, however, was not realised. They were received with so little favour that, out of £1,500,000 authorised to be issued, only about £160,000 got into circulation; an amount too limited to give any relief to the monetary difficulties of the time. In 1697, under Acts 8 and 9 Will. III. c. 8 and c. 20, their use was considerably extended by making them pass in payment of all taxes, duties, etc., and "in all payments at the exchequer due to the king." Originally exchequer bills were, like the ordinary loans at the exchequer, charged upon the produce of certain specified duties imposed or renewed by the act authorising the issue of the bills. As, however, it frequently happened that the duties so appropriated proved insufficient to pay off the loans raised thereon, it subsequently became the practice to make the bills payable out of the general supplies granted by parliament year by year. This practice did not extend to the bills charged on the annual malt duty and land-tax, which duties continued to be specially appropriated, although they often were deficient and had to be made good out of the supplies of the following year. In 1763-64 exchequer bills entirely superseded the old form of loans at the exchequer, and for a period of ninety years, *i.e.* until 1853, continued with one or two exceptions to be the only form of temporary security on which money was borrowed either to meet the ordinary service grants of parliament or for loans granted for purposes of a local character. Amongst the latter may be mentioned the building of churches, public works, poor relief, Irish tithes, Shannon navigation, relief of West India proprietors, etc. The largest amount of exchequer bills issued in any one year was in 1813, when it reached the total of over £54,000,000. The amount of exchequer bills in circulation has at various times been reduced by a process called "funding," *i.e.* by the creation of "funded debt" in lieu thereof. The usual course was to offer government stock to the public at a given price to be subscribed for either in exchequer bills, or money, or both. The bills so subscribed were cancelled, and the money subscribed was applied in paying off other exchequer bills on their maturity. In

cases where the bills required to be funded have been held entirely by the Bank of England or by the national debt commissioners, the exchange of bills for stock has been effected by arrangement, but always under statutory authority. The first instance of funding was in 1709, when exchequer bills with the accrued interest thereon, together amounting to £1,775,000, were funded. Until 1797 there were only two further fundings, viz. £2,000,000 in 1717 and £986,800 in 1746. From 1797 to 1858, when the last "funding" of exchequer bills took place, no less a sum than £143,000,000 was cancelled by the creation of funded debt, of which about £105,000,000 was cancelled during the period of twenty-five years, from 1797 to 1821 inclusive. The largest amount of exchequer bills funded at one time was £27,262,000 in 1818-19. In 1861, under the provisions of Act 24 Vict. c. 5, exchequer bills ceased to be issued annually and to bear a daily rate of interest. The issue of exchequer bills at the present time is regulated by the Act 29 Vict. c. 25. They are of the nominal value of £100, £200, £500, or £1000, and are current for a period of five years, but they may be sent in for payment, after due notice, at the expiration of each twelve months from the date of the bills during their legal currency, and may be paid in for customs or inland revenue duties at any time in the last six months of each year of their currency. The rate of interest is fixed and advertised by the Treasury every half-year, and varies with the rate of interest prevailing in the money market at the time. The bills are prepared and issued by the Bank of England who receive an allowance for the management of the same. There has been no new issue of exchequer bills, beyond the periodical renewals, since 1861. They have been gradually superseded by Exchequer Bonds and Treasury Bills (*q.v.*), and there are none extant at the present time. G. H. H.

Exchequer Bond. Unlike exchequer bills, these securities run for a specific period, say, two or three years from the date of issue. The bonds bear coupons, but may be registered or inscribed in the books of the Bank of England, in which case no coupons would be available, and the half-yearly interest would have to be applied for personally. A. E.

Exchequer Bond, History of.—These are securities on which money may be borrowed by the government under the authority of parliament. They are regulated by the Exchequer Bills and Bonds Act (29 Vict. c. 25), but they differ from exchequer bills by being issued for fixed periods, generally for one to three years, and bearing a fixed rate of interest. In the absence of any special provision in an act authorising money to be raised by this security, the principal of exchequer bonds is repayable by votes of parliament. Formerly, when bonds had matured, and it was found necessary to replace them by new bonds, special statutory authority had to be obtained in each case. It is usual now to take power in the act authorising the issue of bonds to replace them on maturity by new bonds or other securities. Exchequer bonds may, under treasury warrant, be delivered up to be registered or inscribed in the books of the Bank of England, and transferable certificates issued in lieu thereof. This class of security has generally been made use of for special services only.

Exchequer bonds were first introduced in 1853 by Mr. Gladstone, in connection with his scheme for redeeming or commuting certain three per cent stocks and South Seas annuities. Under 16 Vict. c. 23, holders of these stocks were offered, as one alternative, the option of taking exchequer bonds in exchange for their stock. The bonds were to be payable to bearer, so as to be readily transferable; to bear interest at $2\frac{3}{4}$ per cent per annum payable half-yearly until 1864, and thenceforward at $2\frac{1}{2}$ per cent per annum until 1894. They were to be offered for sale, the proceeds to be applied in paying off dissentient holders of stock, and they could be issued in exchange for and in cancellation of exchequer bills; only £418,300, however, were issued, of which £408,900 were in cancellation of exchequer bills. Subsequent acts made these bonds repayable out of moneys voted by parliament, and until such time interest would continue to be paid at $2\frac{1}{2}$ per cent. Power was also taken to replace them in 1894 by new bonds, to be issued for any term not exceeding six years. There was an issue in 1854-55 of £6,000,000, for periods not exceeding six years, to defray expenses connected with the Russo-Turkish and South African wars. Between 1874-75 and 1879-80 £7,750,000 was borrowed from the National Debt Commissioners on Exchequer bonds with three years' currency, for the purpose of granting loans to local authorities for public works. By 44 & 45 Vict. c. 55 they were converted into permanent funded debt. In 1876, under 39 Vict. c. 1, £4,000,000 was borrowed on exchequer bonds, also from the National Debt Commissioners, for the purchase of 176,602 shares in the Suez Canal Company (the value of these is now, 1913, over £39,000,000). An advance of £400,000 in 1885-86 to the government of the Cape of Good Hope for the construction of a railway was provided by the issue of exchequer bonds repayable by moneys voted by parliament. The colony repaid the advance in 1890, and the bonds were paid off as provided. The interest on the bonds was paid by the colony. Under the National Debt Redemption Act 1889 (52 Vict. c. 4) bonds to the amount of £18,100,000 were issued to pay off holders of three per cent stocks who had dissented from Mr. Goschen's conversion scheme of 1888. Of

this amount, bonds for £12,800,000, which were held by the national debt commissioners, were, by the National Debt (Conversion of Exchequer Bonds) Act 1892, converted into permanent funded debt. Since 1890 the principal issues have been £24,000,000 for the purposes of the war in South Africa; £6,000,000 for capital expenditure authorised by Naval and Military Works Acts; £2,600,000 under the Cunard Agreement (Money) Act 1904; £10,000,000 under the Finance Act 1905, to redeem Bonds issued for the South African War; and £21,000,000 under the War Loan (Redemption) Act 1910. In 1905 a new feature was introduced into this class of security. The Bonds issued under the Finance Act of that year were made redeemable in ten years from the date of issue by annual drawings of one-tenth part of the total issue in each year, and special provision was made for the annual redemptions by the appropriation of the requisite sum out of the new sinking fund of the previous financial year. The total amount of Exchequer Bonds now (1914) outstanding is £8,695,249. G. H. H.

EXCHEQUER, CLOSING OF THE (1672). The only part of the public debt which was incurred before the revolution of 1688 originated in the closing of the exchequer on 2nd January 1672-73. Maladministration of the finances, the sale of Dunkirk, and the disastrous close of the first Dutch war, undermined the credit of Charles II., which had been good for some years following the restoration. In 1666 the Commons proposed to appoint commissioners to examine the accounts of those through whose hands the money granted for the war had passed. The bill was delayed in the Lords till the prorogation. Commissioners were appointed two years later, and in consequence of their report the treasurer of the navy was expelled the House of Commons. It was therefore impossible to apply to the Commons for further supplies to execute the secret treaty with Louis XIV. which Charles signed at Dover in May 1670. In the emergency it was suggested that the sum of £1,328,526, the total amount borrowed from the bankers and others on the security of the supplies, should be appropriated with a view to overcoming the financial difficulties of entering on the Dutch war. In 1667 Charles had published a declaration to secure inviolably the course of payments at the exchequer, both with regard to principal and interest. But, on 2nd January 1672-73, he issued a proclamation to the effect that all payments upon assignations at the exchequer would be suspended for one year. The consternation in the city was great; the bankers were unable to meet their engagements, and many people were ruined. To quiet the public mind, the king promised to pay 6 per cent while the money was detained, and in 1676 letters patent were issued, charging the king's hereditary revenue with the interest, which amounted to rather more than £79,000 per annum. This engagement was regularly kept until the year before Charles's death, when payment was stopped. The creditors tried for twelve years, without success, to get legal redress, until, in 1697, judgment was given against the government. Somers, the chancellor, afterwards set aside this decision, notwithstanding the fact that ten out of the twelve judges were opposed to him. The chancellor's decree was afterwards reversed by the House of Lords, and in 1699 it was enacted that after 25th December 1701 the hereditary excise should be charged with the interest of the principal sum, at 3 per cent, redeemable on payment of £664,263, or half the principal. The principal was never repaid, and in 1716 it was incorporated with other public debts in the general fund which was then established. It may therefore still be regarded as part of the national debt.

[Grellier, *History of the National Debt*, p. 12 *seq.*—Hamilton, *Inquiry concerning . . . the National Debt*, p. 66; *State Trials*, xiv. pp. 1-114. —Hewins, "Origin and Growth of the National Debt," *Co-operative Annual for 1889*, p. 228, 229. —Thorold Rogers, *The first nine years of the Bank of England*, 8vo, 1887.—Defoe, *Compleat English Tradesman*, 3rd ed. i. 164, 188, 346, 347, ii. 94. There are several pamphlets dealing with the subject; amongst these may be mentioned, *The Joyful News of Opening the Exchequer to the Goldsmiths* (*in a letter by the Author of the Bankers' Case*, Thos. Twine), 1677.—*The Case of the Bankers and their Creditors, by a true Lover of his King*, 1674.—*Considerations on the Goldsmiths' Letters Patent*, 1678. "His Majesty's (Chas. II.) patent to the goldsmiths for payment and satisfaction of their debt," 1677 (patent granted to Sir Robert Vyner for £416,724, and to eleven other "persons hereafter named" for sums ranging from £295,994 down to £1784, the interest at 6 per cent to be paid by the quarter).] W. A. S. H.

EXCISE, THE, is the name given collectively to those duties which in the fiscal system of the United Kingdom are levied upon commodities produced within the kingdom itself, as distinguished from customs duties (see CUSTOMS) which are levied at the ports upon commodities imported from abroad. The word *excise* (Latin, *excido*) signifies etymologically *something cut off;* as an excise duty may in effect be considered something cut off or deducted, for the benefit of the state, from the price of the article as paid by the consumer. If there were no duty the consumer would pay a lower price for the article. The price, therefore, that he actually pays includes the duty; whence it follows that the duty itself is something deducted or subtracted from the actual price paid. The price in fact is divided into two parts, one part being

subtracted from the whole for the benefit of the state, and the remainder going to the vendor.

Duties of this character, whether levied on articles produced at home or imported from abroad, were at first equally known as excise duties, but in revenue parlance the word has long been restricted to duties on native commodities, those on foreign articles being known as the customs.

An excise duty properly so-called belongs to the category of indirect taxes, because though levied on the producer, its burden really falls on the consumer. It is, however, the practice to classify under the general head of excise the railway duty on passengers, a direct tax; of which the real as well as the apparent incidence generally falls on the railway companies; and a large group of *assessed taxes*, being license duties paid to the state in return for permission to practise or follow certain sports, trades, or occupations; *e.g.* the dog, game, and gun licenses and the licenses on brewers, auctioneers, and pawnbrokers. For a considerable period previous to their introduction into England excise duties formed part of the fiscal system of Holland. They were first imposed in this country in 1643 by the Long Parliament in order to raise funds for the war against King Charles the First. The principal articles first subjected to the duty were ale and beer, cider, perry, and strong waters, to which was soon afterwards added a long list of articles of food and clothing, *e.g.* flesh, victuals, and salt, alum, copperas, hats, saffron, starch, and all manner of silks and stuffs. The prime necessaries of life—flesh and salt—were subsequently struck out of the list, but, nevertheless, the general tendency from the Restoration (1660) to the administration of Sir Robert Walpole was rather to extend than to restrict the operation of these imports.

Walpole, to whom the material progress of England is so deeply indebted, applied himself from the first to fiscal reform. His biographer, Archdeacon Coxe, boasts of him that "he found our tariff the worst in the world and left it the best." By economical administration and the maintenance of a strictly pacific policy in foreign affairs, he enabled himself to help forward the growing prosperity of the country by a substantial alleviation of the burden of taxation. One of the main objects to which he set himself was to make the exportation of our manufactures, and the importation of the principal articles used in them, as free as possible. The reforms which with this view he carried out belong rather to the history of customs than of excise; but in the department of excise proper his beneficent activity made itself felt in the abolition of some duties, the reduction of others, and the simplification of many more. The most famous and the greatest of all his schemes, though it ended in failure, was the bill for warehousing wine and tobacco, generally known as the *Excise Scheme*, which occupies so important a place in our fiscal and parliamentary history that it deserves a separate notice (see EXCISE SCHEME).

The history of the excise since the administration of Walpole cannot here be written *in extenso*. It contains few features of salient interest, nor does it record any convulsion such as that which was excited by his unlucky Excise Scheme.

It will be observed on reference to the following list that the greater part of the excise revenue is derived from taxes on alcoholic drinks. This is no new fact; more than a hundred years ago Cowper drew attention to it in some indignant lines in "The Task."

> "*The Excise* is fattened by the rich result
> Of all this riot, and ten thousand casks
> For ever dribbling out their base contents
> Touched by the Midas finger of the State
> Bleed gold for ministers to sport away."

Such indignation is perhaps misplaced; as it is obvious that taxation should be imposed on luxuries rather than on necessaries; and whatever may be thought of the wisdom of consuming alcoholic drinks, they certainly cannot be classed among the necessaries of life. The tendency of modern legislation has been to throw the largest possible burden of excise taxation on alcoholic drinks, and to exempt, as far as possible, other articles.

Chief Heads of Excise Revenue, from the 4th Report relating to Customs and Excise, 1912-13 (net receipts)—

Beer Duty		£13,200,343
Spirit Duty		18,432,492
Railway Duty		283,929
Patent Medicine Labels		328,319
Playing Cards		32,033
Miscellaneous		205,346
License Duties—		
A. Liquor Licenses—		
(*a*) Manufacturers	£427 054	
(*b*) Dealers	126,714	
(*c*) Retailers	3,949,829	
(*d*) Occasional licenses, etc.	16,737	
Total Liquor Licenses		4,520,334
B. Auctioneers, etc.	87,332	
Hawkers	25,336	
Pawnbrokers	40,328	
Plate Dealers	65,920	
Patent Medicines (Makers and Dealers)	10,780	
Methylated and Motor Spirit (Makers and Dealers)	14,693	
Tobacco (Growers and Manufacturers)	4,736	
Tobacco (Dealers)	102,408	
Refreshment Houses	9,486	
Miscellaneous	694	
Total		361,713
C. Male Servants	16,381	
Carriages	35,956	
Motor Cars	535,146	
Armorial Bearings	5,096	
Total		592,579
D. Gun	20,776	
Game	34,562	
Total		55,338
E. Dog		48,775
Fines and Penalties		2,487
Total		£38,063,688

The Finance Act of 1907 directed that the duties on Beer and Spirits and the Excise Licenses should be paid into the Exchequer, an equivalent amount being issued to the Local Taxation Accounts out of the Consolidated Fund. The power to levy the duties on licenses for game, dogs, guns, carriages, armorial bearings, and male servants was, from 1909, transferred in England and Wales to County and Borough Councils. The Finance Act of 1910 increased the Liquor and Motor Car Licenses, but provided that the payments to the Local Taxation Accounts arising from these, and also from the Beer and Spirit duties, should continue on the scale of the receipts from these duties in 1908-9, the surplus being retained for the Imperial Revenue. This applies to carriage licenses in Scotland and the whole of the motor car licenses in Ireland. The following are some of the duties that have been repealed: Cider, 1830; Glass, 1845; Bricks, 1850; Soap, 1852-53; Paper, 1861; Hops, 1862.

[Dowell, *Hist. of Taxation and Taxes in England* (ed. 1888); Highmore, *Excise Laws*; Ann. Rep. of Commissioners of Inland Revenue, esp. 1870, 1885, and of Commiss. of Customs and Excise.]

EXCISE SCHEME, The, was the proposal introduced into parliament by Sir Robert Walpole in 1733 for applying what is now known as the bonded or warehousing system to tobacco, and afterwards to wine. Instead of paying duty, or giving bonds, the merchant, on landing tobacco from Maryland or Virginia in London or Bristol, was to lodge it in warehouses under the control of excise officers, to pay duty only as he took it out for home consumption, and if taken out for re-exportation abroad no duty was to be paid. The same system was to be extended to wine. Various advantages were claimed for the change. First, it would put an end to sundry frauds on the revenue, from smuggling on an immense scale down to abuses which dishonest merchants, practising on discounts, allowances, and drawbacks, and rapacious lightermen and watermen, carried out at every port in the island. Second, the prevention of these frauds and the decrease of smuggling would be a great gain to the honest trader. Third, accompanied as it was by a simplification of rates, this cheaper and easier collection would be a great advantage to the revenue. Fourth, and much the most important of all, it would tend to make London a free port, and by consequence the market of the world. Such were the advantages claimed for the change at the time. But another, and not the least important, may be added, viz. that it anticipated and fulfilled the principle of Adam Smith's fourth canon of taxation, by taking as little as possible out of the pockets of the people beyond what it yielded to the revenue. The merchant, relieved of the necessity of paying the duty on the importation of the article, would have the use of his capital for a longer time, and would therefore be able to sell at a lower rate to the consumer. In fact the merchant would gain, and the state lose, the interest on the amount of the duty for the period between the importation and the sale of the article. The merchant's, and, through him, the consumer's gain would in practice be greater than the state's loss, as the rate of interest which he would require on his capital, in order to make his business remunerative, would greatly exceed the rate at which the state could borrow; and moreover the loss of the state was more than counterbalanced by the economy of the cost of collection, and the prevention of fraud, which the scheme involved.

Such was the famous excise scheme, which alone would suffice to establish Walpole's reputation as a finance minister far in advance of his age. But the public mind of the time was not sufficiently instructed to receive it; and the design had no sooner been bruited abroad than a popular outcry arose, one of the loudest and fiercest of which history makes mention, which shook his power to its foundations, and at no long distance of time compelled him to abandon the scheme. The parliamentary Opposition, whose motives need no explanation, used all their powers of misrepresentation against Walpole's plan, the object of which was to turn the customs duty on the importation of tobacco into an excise duty on its consumption, as a scheme for levying a general excise over the whole range of commodities. Food, clothing, and the other necessaries of life were, they declared, to be loaded with a crushing tax. Every man's house might be invaded at any hour by the excise officer. Every man's goods and all his dealings would be exposed to minute and ceaseless inquisition. A great standing army of revenue officers would be created, which would overturn Magna Charta, — even undermine parliament. Such were the misrepresentations to which the credulity and factious spirit of the people, and the general unpopularity of the excise as a whole, made them an easy prey. The whole country resounded with shouts of "no slavery, no excise, no wooden shoes." The majority in the House of Commons in favour of the measure went down from sixty-one on the first resolution to seventeen on a subsequent issue; and this dwindling of his supporters, combined with the growing frenzy out of doors, determined Walpole to abandon a measure which in the inflamed temper of the nation could hardly be put into execution without an armed force. "I will not," he said, in announcing his resolution to his friends, "be a minister to enforce taxes at the expense of blood."

The abandonment of the scheme was celebrated throughout the country with rejoicings as for a national victory; the crisis was long remembered; and it is noteworthy that the

popular feeling, many years after the occasion had passed away, found an exponent in the tory prejudices of Dr. Johnson, who in his dictionary defined "excise" as a "hateful tax levied upon commodities, and adjudged not by common judges of property, but by wretches hired by those to whom excise is paid."

For a compact and trustworthy account of Walpole's excise scheme the reader is referred to Lord Morley's *Walpole* (series of English Statesmen, Macmillan and Co.), from which the foregoing description is mainly taken.

Writing more than forty years after Walpole's failure, Adam Smith had still to lament that so excellent a scheme had not been resumed by subsequent ministers (*The Wealth of Nations*, bk. v. ch. ii.). The credit of resuming it was reserved for William Pitt, who notwithstanding the inevitable parliamentary opposition, carried it into law in 1789 (29 Geo. III. c. 68). [See E. Leser, *Ein Accise-Streit* (Walpole's Scheme), 1879.]

The amounts raised by means of the excise have varied much since the first imposition of the tax levied under this name. As the articles subjected to it have differed very greatly, an exact comparison is scarcely possible. In the earlier periods the excise was farmed out, and "in 1657 an offer was made to give, for the farm of the excise and the port duties, no less than £1,100,000 per annum" (Dowell, 2nd ed. vol. ii. p. 13). Up to the end of the 17th century, the yield scarcely altered. Dowell writes (p. 62), "the revenue from inland duties had varied considerably in different years. In 1700 over a million, it was in 1702 nearly £1,400,000." During the later half of the 18th century great additions were made to the tax, though Walpole's proposals were not accepted (see EXCISE).

The gross produce of the tax has been in round figures at the following dates:

1835 . . .	£15,200,000
1855 . . .	£15,300,000
1875 . . .	£28,400,000
1895 . . .	£30,500,000
1905 . . .	£35,600,000
1913 . . .	£38,000,000

EX. DIVIDEND. A stock exchange phrase, shortened, as usual, to signify that the price at which a given security can be bought or sold is exclusive of dividend, which has been, or is about to be deducted. Unless so specified, the security in question is *cum dividend*, meaning that the dividend or interest accrued since the previous distribution is covered by the purchase money. Certain securities, including corporation bonds, exchequer bills, Indian deferred paper, English mortgage bonds, never carry interest in the prices, which are quoted net, the buyer being charged interest up to the date of the completion of purchase (see EX. ALL; EX. NEW). A. E.

EX. DRAWING. This phrase simply means that in case of the DRAWING (*q.v.*) of bonds at par, the bargain is not to be affected by the price obtained by the hazard of drawing, and the buyer gets no benefit. Thus, a specific government bond might have been bought at 90 a week or two before the periodical drawing of such bonds, and the buyer would get £100 if his bond happens to be among the lucky numbers, unless the words "ex. drawing" formed part of the contract. A. E.

EXECUTION is the name of the procedure by which the judgment or order of a court of law is enforced. This is generally done by "writs of execution," which, in the case of judgments of the high court, are issued in the central office or a district registry, and directed to the sheriff of the county in which they are to operate. The usual writs issued in the case of money claims are writs of *fieri facias* (cp. FIERI FACIAS, WRIT OF), commonly called fi. fa. and writs of elegit (ELEGIT, WRITS OF, *q.v.*); claims are also enforced by "garnishee orders," viz. orders by virtue of which the judgment creditor obtains a charge on debts owing to the debtor, or "charging orders" which affect stocks or shares standing in the debtor's name, or, if the debtor has an equitable interest in the property out of which the judgment creditor seeks to obtain payment of his debt, by the appointment of a RECEIVER (*q.v.*) Judgments for the recovery of land are enforced by "writ of possession," and judgments for the recovery of any property other than land by "writ of delivery" or "writ of attachment"; in the case of judgments directing a person to do any act, other than the payment of money, the disobedient party is subject to imprisonment through the instrumentality of a "writ of attachment" or through "committal," which two means of execution differ in form only. Imprisonment on account of the non-payment of money has been nearly abolished, and where it occurs it is punitive in its nature, and not merely a means of enforcing payment (see DEBT, IMPRISONMENT FOR). E. S.

EXECUTOR; the legal administrator of the personal estate of a deceased person. In Scotland if appointed by written nomination of the deceased he is called executor nominate, if by decree of the commissary court executor dative, the former answering to the English executor the latter to the English administrator. His title in either case is completed by *confirmation* (see CONFIRMATION OF EXECUTOR) which answers to the English taking out probate or letters of administration. A husband has in Scotland no absolute right to administer to his wife's movable or personal estate. In default of an executor nominate, a residuary legatee is preferred, then the next of kin, those in the same degree being entitled to be joined if they please, then the husband or wife of the deceased, then the creditors, and lastly a special legatee. An executor differs from a trustee in that an executor's duty is to distribute the fund, a trustee's to hold it.

[Currie on *Confirmation of Executors*.—M'Laren *on Wills*, ii. § 1657.—Dove Wilson, *Sheriff Court Practice*, 4th ed., 546.] J. W. B. I.

EXECUTRY (Scottish); the subject of an executor's administration; the whole of the personal estate of a deceased person, equivalent both to legal and equitable *assets* in England. J. W. B. I.

EXERCITOR (Scottish); a term derived from Roman law and implying one who employs a ship for his own profit in trade, and to whom the profits belong. It matters not whether he is the actual owner or only the freighter. He is liable for necessaries ordered by the master. His obligations properly fall in the first instance under the jurisdiction of the admiralty court.

[Bell's Pr., § 450.] J. W. B. I.

EXHEREDITATIO signifies, in Roman law, a testator's declaration in his will that he excludes from being his *heres* a member of his family belonging to the class of relations who cannot be passed over in the will in silence, but must either be appointed *heredes* or thus declared to be disinherited. E. A. W.

EX. NEW. This refers to the quotation of prices on the stock exchange for shares or other security, the holders of which are about to receive an allotment of new stock at what may be considered an advantageous price of issue. When these words form part of the contract, the seller retains the advantage, if any, and the buyer's right to the security is exclusive of any right to subscribe to the new issue (see Ex. All; Ex. Div.). A. E.

EXPECTATION OF LIFE, a term introduced by De Moivre, denotes the number of years which persons of a certain class, *e.g.* English males, live on an average after a certain age, *e.g.* 20; the average being obtained as follows. The number of years which each of a great many, say *n*, specimens of the class under observation, lives after the assigned age having been observed, the sum of these numbers is divided by *n*. The Expectation is thus the arithmetic mean of the *n* observed numbers (see Average). It is contrasted with another average of the same numbers, viz. the *Median* (see Average), technically termed the "equation of life." The term "expectation" is objected to by Dr. Farr as suggesting the latter rather than the former sort of average. He prefers to say *mean after-lifetime*. Comparing the two kinds of average, Neison seems to think that the expectation of life is not so well suited "for medical and other purposes in which it is required to determine the relative value of an improvement or other change which may have taken place within a given period of life."

(See Death-rate; De Moivre; Insurance; Mean Afterlifetime; Statistics.)

EXPEDITATION. By the Forest Laws (*q.v.*) all mastiffs or other large dogs kept within a forest had to be expeditated, *i.e.* maimed sufficiently to prevent them chasing the deer. According to the laws of Canute the dog was to be hamstrung, but by a charter of Henry II. a somewhat milder operation was allowed, three toes of one forefoot being cut off with a chisel, leaving the ball of the foot intact. For keeping an unexpeditated dog within a forest a fine of 3s., called "footgeld," was imposed, but before the end of the 15th century in many of the English forests this fine had become a customary payment, sometimes called "hound-silver," collected triennially, which formed no small item in the revenues of the forest owner.

[See Ducange, *Glossarium mediæ et infimæ Latinitatis*, Editio nova a L. Favre, Paris, 1884.—Manwood, *Forest Laws*, London, 1615.—Cowell's *Interpreter of Words and Phrases*, London, 1701.—Forest Accounts, some of which are quoted by Manwood.] A. H.

EXPENDITURE or SPENDING has two distinct meanings which are often confused.

1. Expenditure may mean simply the payment out of money, that is, the exchange of money for other goods. In this sense it does not imply any consumption of wealth on the part of any one, and it cannot be opposed to "saving." A man who saves £100 a year ordinarily expends or spends those £100, *i.e.* exchanges them for other goods, just as much as if he did not save anything. The things on which he expends them will be different, but the expenditure, unless of course the money is hoarded, will be the same.

2. Expenditure may mean payment of money for personal consumption on the part of an individual, and consumption, pure and simple, on the part of the community. In this sense it is rightly opposed to "saving." The £100 a year saved by an individual is not in this sense of the word expended or spent either by himself or any one else. It is simply the value in money of a part of the community's income, which, instead of being consumed, has been added to the capital of the country (see Saving, Productive and Unproductive). E. C.

EXPENSES OF PRODUCTION (see Production).

EXPERIENCE. Upon the value of experience in the study of political economy the most contradictory opinions have found adherents.

Some economists have expressed themselves as though political economy were a science similar in type to astronomy—as though all economic truths could be derived by strict deduction from one or two first principles,

such as "All men desire wealth," or "All men are averse to labour." Other economists have denounced general reasoning, and have laid exclusive stress on the accumulation of facts. They would apparently reduce political economy to the task of observing and recording particulars without any admixture of inference. These opposite opinions have rarely been held in their most extreme forms. But by stating them as forcibly as possible we may be assisted to detect the fallacies which they involve.

It will appear upon examination that neither of these principles can be carried out in its integrity. The attempt to carry out either would result in intellectual paralysis.

There has never yet existed an economist so rigorously deductive in his method as not to draw to some extent upon experience of economic phenomena. Many economists have indeed drawn upon a field of experience too restricted to justify dogmatic conclusions. Many economists have been too much influenced by the economic experience of their own time, or of their own country. Even this narrow experience they may not have studied exhaustively. They may have picked up their knowledge of it insensibly, here and there, bit by bit It is thus that the man of business, as contrasted with the student, acquires his knowledge of economic phenomena. Ricardo, the greatest of those economists who are alleged to have been rigorously deductive in method, may be said to have acquired most of his knowledge in this way. Such knowledge, being very partial, may sometimes prove misleading. But even such knowledge has great influence upon the development of theory. Ricardo's economic theories would certainly have been different had he lived in another age than the nineteenth century, or in another country than England.

An economist strictly deductive in method could never get beyond his first premisses. The contrary seems possible because the economist who apparently deduces everything from first principles in reality weaves into his argument statements of fact and wide generalisations which have become so familiar that he and his readers forget how they were first acquired.

Nor has there ever yet existed an economist who merely observed and recorded. Those economists who aimed at this ideal have nevertheless written history. The writing of history involves processes of selection, comparison, and inference, in which the historian's mind is active. No two persons perform these processes in quite the same way, and it is extremely easy to make mistakes in performing them. It is not merely that historians often infuse their work with their own political or religious sentiments, with the prejudices of their own age or their own class. It is rather that the historian cannot construct a narrative out of facts without interpreting those facts. But he cannot interpret the facts without using his mind, without adding to, or rather, without transforming, those facts.

The object of all science, including political economy, is not merely to amass facts but also to explain them. Facts are explained in so far as they are successfully brought under general laws. The general laws are always at first hypotheses, or in the vulgar tongue, guesses—guesses at truth. Hypotheses are suggested by facts, and facts are interpreted by hypotheses. He who forms a hypothesis with hardly any knowledge of the facts is pretty sure to throw away his trouble. He who clings to a hypothesis once formed, neglecting or rejecting new facts, does worse, for he is trying to confirm himself in error. But to refrain from forming hypotheses is impossible to a reasoning creature, and, if it were possible, would be suicidal. The value of experience is not absolute but varies directly as the power of the mind which has the experience. One glance at the field of battle will suggest a decisive movement to the great general. The vicissitudes of a short and obscure life will give the great poet a key to human nature in its infinite variety. The scientific genius, although less brilliant, is not essentially different from theirs.

Whether in physical or in political science the master mind is that to which facts suggest their own explanation. F. C. M.

[Cairnes, *Character and Logical Method of Political Economy.*—Bagehot, *Economic Studies.*]

EXPERIMENTAL METHODS IN ECONOMICS. Experiment in the scientific sense has been well described as "putting in action causes and agents over which we have control, and purposely varying their combinations and noticing what effects take place" (Herschel, *Study of Natural Philosophy*, p. 76). In sciences such as physics and chemistry, in which the phenomena are amenable to arrangement, it is by far the most potent instrument of discovery. Where, however, there is not the same facility for easy manipulation, the inquirer is compelled to fall back on the less effective method of simple observation. Instead of creating instances for himself, he has to find them in nature, or wait till they are presented spontaneously to his view.

Economics, in common with the other social sciences, clearly belongs to the latter class. The phenomena of wealth are closely inter-connected, and are besides affected by the other forms of social activity. Hardly any economic event can be said to be the result of a single cause, it is rather the product of several contributory causes. Nor are the total effects of any one agency easily separable; they are combined with those of others in a whole which cannot be analysed. In technical language "plurality of causes" and "intermixture of effects," the

two great hindrances to the use of experiment (Mill, *Logic*, bk. iii. ch. x.), are generally present in economic facts. To secure the requisite isolation of any phenomenon selected for study is rarely possible. The most rigorous form of inquiry, known as the "method of difference," the essence of which "is the comparison of two instances, which resemble one another in all material respects, except that in one a certain cause is present, while in the other it is absent" (Keynes, *Scope*, p. 170), is plainly excluded, since we cannot introduce a single cause that will have only a measurable effect, nor can we be sure that the surrounding conditions remain unaltered. The "method of agreement" in which the instances compared resemble each other in only one particular is not merely inferior as an experimental resource, but is inapplicable to social phenomena. Two countries or periods that had one common feature would have more than one. In two classes of cases, however, experiment may be sometimes used, viz. (1) in reference to the premises or *data* of economic science, thus the "law of diminishing returns" admits of experimental proof; (2) More important than the preceding exception, which is rather apparent than real, are those cases in which, by deductive reasoning, it can be shown that the action of an economic force is limited, and then its working within those limits can be experimentally ascertained.

These exceptions notwithstanding, it may be said that scientific experiments (*experimenta lucifera*) are a very slight resource in economics.

The case is somewhat different with regard to practical questions. Legislative measures and individual actions are, if so intended, so many experiments on the social system. Thus if several countries, widely differing in other respects, have established a system of peasant proprietary with good results, while several other countries, also widely differing *inter se*, are without that system and show inferiority, we may argue that peasant proprietary is experimentally justified. The same reasoning would be applicable to commercial policy, and has actually been used in reference to the case of Victoria and New South Wales, but illogically, as a number of cases are required to exclude other influences.

Again, by applying special legislation, *e.g.* a particular kind of land tenure, to one part of a country, we can ascribe to its influence the special effects noticed in that district. Practical experiments (*experimenta fructifera*) may also be employed by means of (1) permissive legislation, or (2) temporary legislation.

Private persons also carry out practical economic experiments, as in the cases of profit-sharing (Leclaire), and the recent eight hours day experiment at Sunderland (*Economic Journal*, ii. pp. 755, 756). A large accumulation of instances may even give a very near approach to rigorous scientific proof.

A vaguer use of the term "experimental method" is common in continental and especially in French writers. J. B. Say, for example, declares that the true method of political economy is *La méthode expérimentale qui consiste essentiellement à n'admettre comme vrais que les faits dont l'observation et expérience ont démontré la réalité* (*Traité, Discours prélre*, p. x. 5th ed. 1826). Here "experiment" is used as synonymous with "experience"; it therefore includes observation and experiment in the strict sense.

Lewis, *Methods of Observation and Reasoning in Politics*, ch. vi. —Jevons, *Methods of Social Reform*, pp. 253 *seq.* —Léon Donnat, *La Politique Experimentale*, 2nd ed. Paris, 1891]. C. F. B.

EXPERT. An expert may be defined as a person possessing special knowledge of any science or art. Art is here taken in its most comprehensive signification, to include the useful as well as the fine arts, cooking or carpentry as well as music or painting. The opinion of an expert on matters connected with his own subject is more likely to be correct than the opinion of a man to whom that subject is almost or altogether unknown. But the degree in which an expert's opinion outweighs the opinion of the ordinary man will vary according to the nature of the subject.

For, first, the subject may be one with which the ordinary man has no acquaintance, or it may be one with which he is acquainted, although not so fully as the expert. Thus every man in his senses knows to some extent what food is wholesome, although he may not know so much on this point as a qualified doctor. Every man who can write has some power of comparing hands, although not so much power as belongs to an expert in handwriting. But only an expert in navigation can determine the exact position of a ship out of sight of land. Only an expert in astronomy can determine the probable distance of a fixed star from our planet. In such matters the judgment of the ordinary man is absolutely worthless.

Secondly, the subject may be so complex that no expert has more than a very imperfect knowledge of it. Political and economic science are characterised by this complexity. Upon political or economic questions the opinion of a man who knows much is far more valuable than the opinion of a man who knows little or nothing; but even the opinion of the man who knows much affords a very imperfect security. Such complex questions often present different aspects to different classes of experts. Let us suppose that an opinion is required on the expediency of a law to regulate the hours of labour. At least five different classes of experts

are more or less entitled to be heard:—(*a*) The economist who has read and reflected upon the theory of economic phenomena; (*b*) the political philosopher who has read and reflected upon the theory of the state and of legislation; (*c*) the statesman who is familiar with the practice of government, and can judge what kind of laws it is usually expedient to make and possible to enforce; (*d*) the employer who has had the opportunity and the will if not the wisdom to discover how production can be carried on to the greatest profit; (*e*) the workman who has had the opportunity and the will, if not the wisdom, to discover what are the best conditions of life which he can obtain for himself; all these men can bring to the determination of the problem a knowledge which other men do not possess, and are entitled in a greater or less degree to speak with the authority of experts. One person might, of course, combine more than one of these characters, and might, therefore, claim a higher degree of authority.

Thirdly, the subjects of knowledge differ in the degree in which they excite passions such as prevent the expert from employing his intellectual superiority to its fullest advantage. On any subject, indeed, were it astronomy or textual criticism, the judgment of an expert may be disabled by vanity or love of contention. But on those subjects which immediately touch the interests of mankind, notably theological, political, and economical subjects, the judgment of the expert is more likely to be disturbed by his passions. These passions are at least as ungovernable in ignorant men. But wherever they prevail they lessen the interval between the ignorant man and the expert. For the finer the intellectual instrument the more it is disturbed by acute emotion. F. C. M.

EXPERTISE (French) is the legal process by which judges, when called on to decide special or technical cases, may appoint, on their own authority, or on the demand of one or both of the litigants, persons possessing the necessary knowledge or experience, called experts, to examine, and report on, the points at issue. The conditions under which those operations are conducted are laid down in Arts. 303-323 of the Code of Civil Procedure. One of the most frequent applications of the law is in the settlement of disputes between foreign importers and the French customs authorities relative to the class, quality, origin, or value of merchandise subject to duty. The first supplementary convention to the Anglo-French treaty of commerce of 1860 conferred on British importers in France the right to demand an *expertise*. When the Customs propose to exercise the right of preemption, the importer and the customs each nominates one of the experts. In case of disagreement the two experts choose an umpire, and if they cannot agree on the choice, the umpire is appointed by the president of the nearest tribunal of commerce. Objections were frequently made that the persons named as experts did not possess the necessary qualifications, and on the renewal of the treaty of commerce, in 1873, a protocol was signed, stipulating that they should be chosen from a list of merchants or manufacturers drawn up by the chambers of commerce in each locality having a customs bureau. A British chamber of commerce had just been founded in Paris, and that body submitted to the Paris chamber (French) the names of the principal British merchants in Paris, for them to be comprised in the list of experts; but the French chamber of commerce refused to nominate them on the ground of their foreign nationality, although British traders had previously been accepted as experts. The British chamber appealed to the Foreign Office, and on the intervention of the British ambassador the French minister of foreign affairs considered the claim a just one, and some of the names proposed were added to the list of experts in Paris. Those names were, however, subsequently removed from the list on the expiration of the treaty of commerce in 1881, and British importers who now have disputes with the French customs can only be represented in an *expertise* by a French merchant or manufacturer, who is naturally disposed to impede rather than to facilitate foreign competition in his own trade. There is no appeal from the decision of the experts in commercial affairs, when they agree, but civil *expertises* are still governed by Art. 323 of the Code of Civil Procedure, under which judges are not bound to adopt the opinion of experts if they are not convinced by it. T. L.

[*Lois du 27 Juillet 1822 et du 7 Mai 1881; arrêts de la Cour de Cassation, 30 Avril 1838, et 30 Janvier 1839.*]

EXPLOIT. The French verb *exploiter* primarily means simply to use in such a way as to make a profit out of. It is applied to such actions as working a mine or a railway, cultivating a farm, or publishing a newspaper. There are some things which it is admittedly improper to use in such a way as to make a profit out of them; it is disgraceful, for instance, to *exploiter* any one's credulity, ignorance, or good nature. Hence the word comes to have sometimes a bad sense. The socialists who teach that the capitalist obtains an illegitimate gain by employing men for wages have applied the term to his action in this bad sense. To *exploiter* men or labourers thus means to use them in such a way as to make a profit out of them, it being at the same time implied by the use of the word that this, though not perhaps disgraceful to an individual who does it under present circumstances, is fundamentally improper, and would not be allowed in an improved state of society.

It is almost exclusively in this bad sense that

the word "exploit" has been introduced into English. E. C.

EXPORTS AND IMPORTS, see IMPORTS AND EXPORTS.

EXPORTS, DUTIES ON. Duties on exports have been generally condemned by modern economists, but they survive in many of the British possessions as well as in some foreign countries. The history of these duties in Great Britain is merged in that of the customs revenue. The original customs duties were, in fact, duties on exportation. They appear to have been levied by prerogative of the crown from early times, but the first statute which imposed them was one of 3 Edward I.

Two somewhat diverse theories have been suggested as explanatory of the origin of these duties in England. One, which we find first indicated by Sir W. Petty, is adopted by Mr. Dowell (*History of Taxation*). It holds that the sovereign power simply levied a toll on all merchandise, whether inward or outward, as a reward for its protection of the merchant. The duties "were in the nature of a premium paid to the king for insurance." The analogy of the customs duties levied at Athens and at Rome (*portoria*) may be held to favour this view. The other theory is on the whole the more probable, and is that adopted by Mr. Hubert Hall (*History of the Customs*); the king's chief concern was to see that he got as much revenue as he could. He was from ancient times entitled to a purveyance or prise on certain classes of commodities—"if then these were conveyed beyond the kingdom the crown would suffer a possible loss to its state or dignity." When it was found that the wools and hides on which the king was entitled to the internal toll or prise were being exported and escaping taxation, he at once put on a countervailing export duty in order to secure his revenue (see PRISAGE).

It seems probable that these duties were adjusted at the discretion of the crown according to its necessities, and Mr. Hall thinks that immediately before the statute 3 Edw. I. "it is probable that the commuted prise on staple exports, such as wool, hides, and minerals, was taken at an average rate of half a mark per sack of wool or an equivalent bulk of woolfells, a mark per last of hides, and an *ad valorem* duty of 3d. on every librate or twenty solidi of lead or tin."

The Act of 3 Edw. I. (1275), which is the first instance of levying taxation by act of parliament, placed the export duty at

½ mark per sack (26 stone) of wool.
,, ,, per 300 woolfells.
1 ,, per last of leather.

These are the *custuma antiqua sive magna*, and the chief contributor to the revenue was the wool. Some thirty years after the passing of this act the produce was as follows:

Wool at 6s. 8d. . .	£1501	0	9¼
Woolfells at 6s. 8d. .	57	15	1
Leather at 13s. 4d. .	0	8	7½
Total of the great customs	£1559	4	5¾

In February 1303 an agreement was made with the alien merchants, whereby they undertook, in consideration of the king's protection, to pay 50 per cent beyond the ancient customs on wool and leather, and certain fresh rates on other commodities whether exported or imported. Rates were specified for wax, cloth, and wine, and all other articles were to be charged 3d. in the pound of 20 shillings. These were the *custuma nova sive parva*.

The next development of the exports (as part of the customs) duties was by the statute of 49 Edw. III., which levied the due of tunnage and poundage, afterwards known technically as a subsidy. The poundage was a duty of 6d. on the pound-weight of all articles exported and imported.

With variations in the rate these two forms of export, and import, duty were continued on the same basis down to the Restoration in 1660. They were granted by the Commons for periods of years as a rule; sometimes for the life of the reigning sovereign. After Agincourt in 1415, such a life grant was made to Henry V., and the duties had gone up considerably, as follows:—

	From denizens.			From strangers.		
On wool per sack	£2	3	4	£3	0	0
On woolfells	2	3	4	3	0	0
On leather per last	2	3	4	5	6	8

and in the following reign the rate for wools, etc., was raised to £5 for strangers, and that for leather to £5 for natives. The subsidy of poundage had already been raised to 1s. on the pound-weight, and there was a special duty of double that amount on tin exported by strangers. In 1421 the yield of all the customs was £40,687, of which the great custom on wools, export duty, produced £26,036; in 1431 the total was £34,851, of which the greater proportion was derived from export duties. But the revenue appears to have been a falling one; the customs regulations were anything but complete, as is shown by the act of 27 Hen. VIII. c. 14, to regulate the exportation of leather from other ports besides Southampton and London; and there were constant interferences with the export trade by way of partial or complete prohibition, as late as Mary's reign. In 1570 the value of woollen goods and cloth exported from England amounted to £26,665, and from this was obtained £2388 : 10 : 11, viz. customs £1523, and subsidy £865 : 10 : 11; gradually the revenue from imports was becoming the more considerable.

The Long Parliament, after declaring in 1640 that "no subsidy, custom, etc., may be imposed upon any merchandise exported or imported without common consent in parliament," proceeded to levy heavy duties on the old lines. The year 1660 marks the beginning of a transition stage. In the Book of Rates for this year, 212 articles were subject to export duty "rated for duty outwards." The duties granted to Charles II. were levied with some modifications in the ninth and tenth years of William III. as the "new subsidy" and continued by 9 & 10 Anne, c. vi. (1710) by the act "for reviving, continuing, and apportioning certain duties upon several commodities to be exported and certain duties on coal, etc., etc." But in 1721 the export duties on corn, woollen fabrics, linen manufactures, and other staples were repealed; the mercantile theory with its mania for exportation had found these duties obstructive. Nevertheless in Saxby's manual of the Customs (dated 1757) some twenty-five pages are occupied with the enumeration of the goods rated for duty outwards, and the directions for paying the proper duties, and in Pitt's consolidating Customs Act of 1787 there are fifty articles subjected to export duty, many of them being of foreign origin. These duties were increased during the great war, and at the beginning of the century, under the act of 1809 (49 Geo. III. c. 98) Sched. A "Outwards," which rated for permanent duty, and in a parallel column for temporary or war duty:—

(*a*) Foreign commodities to the number of sixty-three at varying, chiefly specific, duties.

(*b*) British goods, of which coals, skins, and other articles were subject to specific duty; all other goods, wares, etc., to an *ad valorem* duty—excepting cotton, linen, sugar, woollen goods, and certain special exemptions with reference to the port of destination.

By an act of 1810 linen goods were subjected to an *ad valorem* duty of 15 per cent on export. But with the close of the war and the progress of the new economy the backward policy was reversed. In 1815 the export duties produced £365,598, and in 1826, £102,255. Under Mr. Huskisson, in 1826, the schedule of articles left subject to export duty was as follows:—

Coals, per chald. 1s. 6d. to 30s. 3d. according to destination, etc.
Culm, per ton, 1s. to 10s., according to destination, etc.
Skins, per 100, 1s.
Wool, per lb., 1d.
Woollen manufacture, per lb., 1d.
Home produce with certain definite exemptions, *ad valorem*, 10s. per £100, *i.e.* ½%,

and with Peel's reformed tariff of 1842 these disappeared altogether. In 1901 an export duty of 1s. a ton on coal was levied, producing about £2,000,000 per ann. This was removed in 1906.

One of the few accidental gains to be placed to the credit of the old mercantile theory was that it tended to discourage duties on exportation. Sir W. Petty (1679) shews a consciousness that such duties required careful watching. Sir John Sinclair (1790), who had imbibed the doctrines of Adam Smith, is the first writer apparently who distinctly expresses a doubt as to the propriety of their imposition. Formerly, he writes, almost every commodity sent out of the kingdom was subject to such a duty; it was supposed that the duty came out of the pockets of foreigners, but "such ideas are now exploded." He referred to the principal export duties at that time, under Pitt's recent act, as being those on coals and lead, with certain duties on raw produce intended to give our manufacturers "an advantage over rivals." McCulloch (*Taxation and the Funding System*) has a full discussion of the economic propriety of export duties, and suggests the grounds on which they have generally been condemned. His statement of the arguments for and against the retention of such a duty on coals, published just at the time when that duty was finally removed, is of special interest; it embodies the argument in which economists have for the most part summed up the whole discussion on these duties, viz. that they should not be levied except in the case of a country which has a monopoly of supply of the commodity taxed, or such an advantage in its production as to approximate to a monopoly.

Turning to the British possessions it is natural to find that in those which were acquired during the 17th century, when export duties were an unchallenged feature in the fiscal system of this country, the export duty is, so to speak, bred in the grain; in the colonies established towards the close of the 18th century such a duty practically had no place.

The notorious 4½ per cent *ad valorem* duty which created such squabbles between the crown and the West Indian islands was the progenitor of colonial revenues. At the time of the Restoration, when all the revenues of the crown were being revised, plantation enterprise was at the height of its activity, and it occurred to the crown advisers that the new dominions beyond the seas ought to contribute their share. Thus the origin of colonial customs was precisely the same as that of the English customs. The patent of 1663, constituting the office of commissioners of customs, empowered them to levy and collect a duty of 4½ per cent *ad valorem* on all dead produce exported from Barbados and certain other sugar colonies, and from the plantations in America. In respect of the latter no such duty was ever actually levied. In the West Indies it was the cause of much grumbling; already, in 1689, it was urged that "moreover this four and a half is collected in such manner that in the judgment of all that have

tryed it, the attendance and slavery is a greater burthen than the duty" (*Groans of the Planters*); it was found to be "the same thing in effect as a tax on lands." It was the subject of a great action in 1763 in a case arising on the island of Grenada, Campbell *v.* Hall, where payment of the duty was refused on the ground that the island was ceded by France on the condition that the privileges of the former *régime* should be secured to the inhabitants. This led to the exception of "the Ceded Islands," and Jamaica, from the operation of the duty. It was for many years paid in kind, and in 1778 the right so to pay it was successfully contested (Macpherson's *Annals*, iii. 625). This is not remarkable in an age when sugar was the current money of account. For the better collection of this and other duties the customs department had branch establishments in the colonies, and they continued to levy the 4½ per cent till it was abolished with slavery in 1838.

Of the other colonies the only ones in which duties on exports were levied in the first quarter of the 19th century, were the Mauritius (certain rates on sugar, coffee, cotton, indigo, and one or two other articles), the Cape (on all produce shipped, half the amount of the import duties on similar articles), and Ceylon (on cinnamon, etc.). These were relics from foreign rule in each case, and disappeared gradually under British rule. The export duty on cinnamon from Ceylon had an instructive history, as it was exceedingly profitable when Ceylon had almost a monopoly of that spice, it was a chief element in driving other tropical countries to compete with Ceylon, and was dropped, in 1833, too late to save the colony's pre-eminence in that export.

In India export duties were a relic of the old system: when the imperial government took over the provinces in 1857 there were export duties levied in all the presidencies, and chiefly on grain, rice, indigo, lac, opium, silk, tobacco, and native manufactures of all sorts. An act of 1860 abolished those on manufacture of wool, flax, hemp, jute, etc. At the present day those on rice, opium, and certain other commodities remain. The Indian export duty on rice has been quoted by Fawcett and others as an instance where the duty was probably justified owing to the great advantages possessed by the exporting country in the production of the commodity.

The most striking modern recrudescence of export duties was in connection with the immigration of Indian coolies to the sugar-growing colonies. One of the conditions of government aid in importing coolies was that the planters should pay their fair share; and after much discussion an export duty on sugar and the other produce of the plantations was settled as the best method of obtaining the necessary contributions. Hardly therefore were many of the West Indian colonies freed from the ancient 4½ per cent duty than they undertook a new specific duty on exportation of sugar and other produce. The St. Lucia Schedule was a fair sample, imposing duties on—

Sugar	Charcoal	Hides
Rum	Logwood	Cocoa
Molasses	Firewood	Coffee

From a return given to parliament in 1854 it would appear that then the only British colonies which levied a duty on exports were the Mauritius and the West Indian islands of St. Lucia, St. Christopher, Nevis, Montserrat, and the Virgin Islands—on sugar; and Turk's Islands on salt. But it was inevitable that a principle admitted in the case of a special service should sometimes extend itself; and in later years there has been an increased tendency to levy export duties in the West Indies. In New Brunswick, for a time, there were certain export duties on lumber, and in Prince Edward Island in 1861 a special duty was provisionally authorised to be collected for a special purpose on all agricultural produce exported. In the Bahamas so lately as 1870 and 1873 a general export duty on all produce was for a time imposed; the Virgin Islands were probably the last instance of the survival of general export duties, which were almost entirely evaded. Such duties were distinctly condemned by the royal commission which inquired into the finances of various West Indian colonies in 1883-84 (*v.* their report, pt. iv.).

Export duties have recently been levied, usually for purposes of immigration, in many of the West Indian colonies. In one or two cases they are levied under a delusive name, *e.g.* "statistical tax," in others they are indirectly increased by wharfage duties for outward goods. In Trinidad, besides the duties on products of the cane, there is an export duty on pitch. In Turk's Islands that on salt remains a chief source of revenue. New South Wales, Western Australia, and Natal levy one on gold. The Fiji Islands, for purposes of regulating the trade, levied one in 1877 on silver coin and sandalwood, and in 1887 on *bêche de mer*. Newfoundland has from time to time used an export duty on codfish as a means of taxing the merchants. The duties on pitch, gold, and salt are generally looked on as royalties and in the nature rather of a rent than a tax.

The plantations on the mainland of America appear never to have paid an export duty, and the United States maintained the tradition, which also fell in with their policy of encouraging exportation as much as possible. One feature in the commercial policy of the United States in the years round 1890 deserves special mention. In the many treaties or agreements which they were then negotiating with the Central American and other states, they carefully guarded themselves against the possibility of an export duty

being levied in the contracting state; apparently arguing that the imposition of such a duty is an attempt to raise the price to the United States consumer, and must, therefore, be treated as an unfriendly act to be punished by a countervailing duty.

In foreign countries duties on the exportation of commodities are still prevalent, levied sometimes on the chief product of the country, as on the charcoal and olive oil of Italy, in other cases as protective of home manufactures, as in the case of Swedish iron.

The views which have prevailed as to the incidence of export duties have been indicated in several passages above. The accepted view that the duty operates as a restriction to exportation, except where the exporting country has a monopoly of production, appears to be correct. If all countries in exporting a particular commodity levied export duties upon it the price of the commodity would be raised to cover the amount of the duty, and the foreign consumer would eventually pay the duty or the greater part of it. But as the facts are contrary to this hypothesis, it will be found in almost all cases, *e.g.* sugar exported from the West Indies —that the price paid by the foreign consumer is determined by more general considerations: the exporter cannot control it; the duty falls on him and enhances his expenses in production, or perhaps more accurately it lessens his profits. In any special case the factors which determine price are important in deciding the incidence. The case of monopoly is nowadays hardly of practical importance.

Reports and Papers.] C. A. H.

EXPROPRIATION. Expropriation may be defined as the compulsory sale of private property either to the state or to private parties who have received specific authority from the state.

That such compulsory sale is sometimes indispensable to the public welfare is too obvious to need demonstration. The necessity for expropriation can rarely arise in the case of movable property. Such articles can almost always be obtained by a voluntary transaction, if not from one owner, then from another. The acquisition of a particular movable can hardly ever be matter of necessity to the state. Even a unique picture or statue is a luxury which it is not advisable for the state to acquire at the cost of infringing upon the general freedom of an owner to dispose of his property at his pleasure. In some countries the finder of antiquities is obliged to transfer them to the state on receiving compensation. But this exceptional rule is of no economic importance. With reference to immovable property the case is different. Not only is land necessary as the basis of human industry and limited in extent, but the land suitable for a specific public purpose is often very narrowly limited indeed. In order to lay out a street or a railway, to construct a public building, a fortress, or a harbour, particular pieces of land must be obtained, even although their owners do not desire to part with them. If no compulsion were to be used in such cases the state would be reduced to offer a preposterous price or to forego a necessary improvement.

But expropriation is allowable only in order to effect an appreciable public good. All compulsion is painful, and pain should not be inflicted without a rational object. The presumption is in favour of letting every man do as he likes with his own. Therefore the burden of proof lies upon those who advocate expropriation in any particular instance.

To what extent expropriation should be carried is a wider question than that to which these remarks must be limited. We need not inquire whether the state would be justified in expropriating certain species of property on the ground that it could manage them more advantageously to the whole community than private owners could or would do. Such an inquiry belongs rather to the head of STATE INTERFERENCE (*q.v.*). Nor need we inquire here into the kindred question whether it would be right to expropriate, say, large estates in order to break them up and sell the land in small parcels so as to multiply peasant proprietors. Nor need we determine whether the state would do well to acquire certain species of property on the ground that they tend to increase in value merely through the general progress of society, and that this increase should go to enrich the community rather than individuals (see INCREMENT, THE UNEARNED). It is enough for us that the necessity of expropriation in certain cases is admitted by the great majority of persons who have considered the subject. We have only to consider upon what principles expropriation, when necessary, should be conducted.

In case of expropriation the owner should receive at least the price which he could obtain in the open market, if he were disposed to sell. The market price is the only impartial and trustworthy measure of the value of property. It represents the value of property under all the actual circumstances, including the reasonable expectations to which the laws and policy of the state have given rise. It is unworthy of a civilised government to pursue a certain class

of owners with covert hostility, to burthen them with overwhelming taxes, or to deny them effectual protection, in order to make their property worthless, and then to buy it at so many years' purchase of zero. Yet these expedients are occasionally recommended in our time by persons who profess to have a special sense of political justice. Even in the case where the state interferes to suppress a form of property distinctly condemned by the improved morality of the general public, it still owes compensation to the proprietors affected. When the British parliament compensated the West Indian slave-owners it acted on the sound principle that the state, which for many generations had recognised and maintained the lawfulness of slavery, was *particeps criminis*, and ought to take its share of the loss. But in cases of this kind the right amount of the compensation may be more doubtful than in others.

Where the owner of property expropriated has increased its returns by a violation of the law the case is different. If the owner of a house permits it to be over-crowded with lodgers, he has no right to compensation for the extra rent which he has thus received. If he lessens his outgoings by allowing the house to fall out of repair, the cost of the repairs necessary to make it habitable should be deducted from the compensation paid. If the house is so ruinous that no repair can make it habitable, he is entitled to compensation only for the site and the materials. In other words the market value, which forms the basis of compensation, must be understood as *the market value obtainable without a breach of the law*. It would be monstrous that a man should obtain compensation for relinquishing a profit which is illegal.

Subject to these qualifications, then, the amount of the compensation should not be less than the market value. But it may justifiably be somewhat more. Over and above the loss of his property, he who sells against his will suffers the pain of compulsion, and for this a reasonable allowance should be made. Distinction may be made between objects which have and objects which have not "a value of affection." Thus one acre of arable land differs from another acre of arable land only in its capacity of producing wealth. He who is compelled to sell one field is usually able to buy another field which will do just as well. But the house where a man has lived all his life may be much more to him than any other house of equal value. If compelled to sell it, he cannot buy another which will be the same to him. *Prima facie*, therefore, the indemnity for constraint put upon an owner to sell should be more liberal in this case than in the other. Compensation, however, must be assessed on general rules, and fine gradations of feeling cannot always be taken into account.

Yet another difficulty remains. The owner who is compelled to sell part of his property may have the value of the remainder greatly augmented by the public works for which the land was taken. Whether this prospective improvement should be taken into account in assessing the compensation due to him is a much-disputed question (see BETTERMENT).

The principles of compensation will be the same whether the party taking by compulsion be the national government or a municipal authority or a private joint-stock company or individual. But, when the state confers the power of expropriation upon its subordinates or upon private parties, it is entitled to determine the objects for which this power shall be exercised, the extent to which it shall be exercised, and the service which shall be rendered to the public by those who are invested with it. These, however, are points which must be determined by common sense in each case as it arises. F. C. M.

EXTENSIVE CULTIVATION (see INTENSIVE CULTIVATION).

EXTENTS (see COURT ROLLS, MANORIAL ACCOUNTS, and EXTENTS).

EXTRANEUS. A freeman by birth coming into a manor from outside, and so opposed to *nativus*, but holding land on it by villein tenure. He could not, however, be ejected as long as he performed the services due from his holding, and he could surrender the holding at will. Vinogradoff shows (*Villainage in England*, 1891, p. 63), against Britton's theory, that the descendants of an *extraneus* might lapse into villainage in the fifth generation.

APPENDIX

ADAMS

ADAMS, Henry Carter (1851-1921), teacher, economist, and statistician, was born in Iowa on December 31, 1851. Of Puritan stock, his father was of the small band of Andover theological students of Congregational faith, who set forth from New England in 1842 to spread the gospel westward. Young Adams's formal education was delayed by delicate physique, so that not until 1869 was he able to enter Denmark Academy, and thereafter to attend Grinnell College, from which he graduated in 1875. After teaching a year at Nashua, Iowa, he entered Andover Theological Seminary in 1875, in preparation for the ministry. There economic and social questions in their relation to moral reform drew his interest away from formal theology, and the purpose of entering the ministry yielded to an awakened student impulse. An extraordinary opportunity presented itself, perhaps it indeed contributed to young Adams's restlessness, in the opening of the Johns Hopkins University in Baltimore in 1876, under the brilliant leadership of President Daniel C. Gilman, with the declared plan of exclusive devotion to post-graduate work. Adams made successful application for one of the new fellowships, and spent two formative years in Baltimore in a rare company of teachers and students, receiving his doctor's degree in 1878—the first, thanks to alphabetical arrangement, conferred by the new institution. Local friends thereafter made it possible for him to continue studies in economic and social science, for the next two years, in Oxford, Paris, Berlin, and Heidelberg. In Berlin he won the friendship of Andrew D. White, President of Cornell University, at that time travelling in Germany, with the result of appointment first as lecturer and later as instructor at Cornell.

In 1886 a newspaper report of an address by Adams to the student body on the Gould railroad strike, gave offence to Henry Sage, who had made large donations to Cornell, and this led to the young instructor's dismissal. An invitation to join the faculty of the University of Michigan was accepted, and although four years later, by unanimous vote of the Cornell authorities, of which Henry Sage was still a member, Adams was asked to return to Cornell, he elected to remain in Ann Arbor. In succeeding years flattering offers came from many institutions, but Adams was firm in his loyalty, and his association with Michigan continued unbroken until his death.

Like many other American economists, Adams was deflected from a severe academic course by the appeal of public service. When Judge Thomas M. Cooley, a close personal friend, accepted the chairmanship of the newly constituted Interstate Commerce Commission, he prevailed upon Adams to undertake the organisation of a statistical bureau for the Commission. Accepting reluctantly and in the thought of temporary service, Adams became absorbed in the work, and for the next twenty years served as statistician of the body, in addition to retaining by arrangement his University connection. From time to time his services were requisitioned in related capacities. He directed the appraisal of railroad property in Michigan for tax purposes, and he figured repeatedly in valuation proceedings. In 1913 Adams accepted the invitation of the Chinese Government to devise an accounting system for its public railways, and spent two years in China for this purpose. His competence and devotion are recorded in a tablet brought to the United States and placed upon his grave on February 22, 1922, by the Chinese Delegation to the Washington Disarmament Conference. Death had come after a brief illness at Ann Arbor, on August 11, 1921.

As a teacher, Adams exerted largest influence by direct contact and personal guidance. Simplicity of manner, clearness of exposition, and sincerity of purpose distinguished his conduct of large undergraduate classes. But it was upon the smaller company of advanced students, pursuing inquiries in the fields of his prime interest, that Adams left a determining impress. No small proportion of the younger Americans now identified with scientific work in railway transportation and public finance owe inspiration to Adams's teaching.

As an economist, Adams's interest was first

aroused by the inter-relations of political economy and ethics. This impulse, with its applications to social reform, grew steadily. He delivered courses of lectures on ethics and economics at the Plymouth School of Applied Ethics, and contributed papers to the International Journal of Ethics. His interest in public finance traces to student years at Johns Hopkins, and found first expression in a doctoral dissertation on "Taxation in the United States, 1789-1816" (Johns Hopkins University Studies in Historical and Political Science, Second Series, nos. 5-6). In 1887 appeared *Public Debts*, the ablest fiscal monograph from an American economist in the post-war generation. Thereafter, at Michigan year after year, and at Johns Hopkins for a briefer term, Adams lectured upon public finance, the fruit of his labours appearing as his largest work, *The Science of Finance*, in 1899. Long delayed by the pressure of governmental service and eventually completed under pressure, the work was presented to American students as the first general exposition of public finance projected against the background of American economic and political conditions. As such it has served with Professor Seligman's brilliant teaching and inquiry to inspire a succession of American studies and texts in fiscal science. Adams was one of the group of ardent young scholars who founded the American Economic Association at Saratoga in 1885. He was a conspicuous figure in its early scientific meetings, and contributed to the first volume of its Proceedings a penetrating and influential monograph on "The Relation of the State to Industrial Action." He served with distinction as its President in 1895-96. His presidential address at the Baltimore meeting (1896) emphasised the interdependence of jurisprudence and economics, a theme to which, as to the relation of ethics and economics, he reverted repeatedly in teaching and writing.

As statistician, Adams's work was practical rather than theoretical. Drawn by unexpected circumstances into the field, he succeeded, as statistician of the Interstate Commerce Commission, in evolving a system of uniform railway classification and accounting, and integrating statistical service with governmental regulation. He accomplished this by a rare mixture of technical competence, administrative ability, and personal force. He made no contribution to statistical science as such; but "the universal acceptance to-day of statuted accounting and statistical practice as an indispensable instrument for the effective regulation of railroads and public utilities remains a lasting monument to the intelligence and validity of his pioneering efforts." The results of his experience were set forth in *American Railway Accounting* (1918).

R. A. Seligman (*Economic Journal*, June 1922.]

J. H. H.

AGRICULTURAL HOLDINGS ACTS.* Between 1883 and 1921 various acts were passed, which were replaced in 1923 by a consolidating statute repealing all previous enactments on the subject and embodying in one act, viz., the Agricultural Holdings Act 1923, the present statutory law regulating the relations of landlord and tenant on agricultural and market garden holdings. The principal provisions of this act may be summarised under seven heads: (*a*) Compensation for improvements, (*b*) compensation for damage by game and for disturbance, (*c*) arbitration, (*d*) fixtures, (*e*) notices to quit and other miscellaneous rights of landlord and tenant, (*f*) distress, (*g*) special provisions as to market gardens.

(*a*) It is provided that the tenant of agricultural land shall be entitled on quitting the holding to compensation for improvements made by him at his expense during his tenancy. The act in the first schedule enumerates three classes of improvements. The first class are improvements of a permanent nature, such as the erection of farm buildings, laying down of permanent pasture, making of gardens, and planting of orchards, for which compensation can only be claimed if the landlord has given a previous consent in writing. The second class is drainage, to obtain compensation for which the tenant must have given notice of his intention to execute to the landlord, who has then the option of executing the work himself, charging the tenant interest on his outlay. The improvements comprised in the third class are such as tend to the temporary improvement and fertility of the land, such as chalking, liming, application of purchased artificial or other purchased manure, and laying down of temporary pastures with clover, grass, sainfoin or other seeds, also repairs to buildings necessary for the proper cultivation or working of the holding. No consent by the landlord to improvements in the third class is required. The sum payable for compensation for an improvement in any of these classes is the value of the improvement to an incoming tenant.

(*b*) A tenant who has sustained damage to his crops from deer or winged game, the right

to kill which is vested in the landlord, is entitled to recover from the landlord compensation for such damage if it exceeds the sum of one shilling per acre. A tenant is also given a very important right to compensation for disturbance if he quits his holding by reason of a notice to quit given by the landlord. This is to compensate him for the loss or expense attributable to quitting incurred upon or in connection with the sale or removal of his household goods, implements, fixtures, farm produce or farm stock, and to avoid disputes is to equal one year's rent of the holding, unless the tenant can prove that his loss or expense exceeds that sum, up to a maximum equal to two years' rent of the holding. He will, however, lose this right to compensation if it is shown that he was not cultivating his holding according to the rules of good husbandry which are defined in the act, or has failed to pay his rent within a reasonable time when demanded, or to remedy a breach of his contract of tenancy, or to submit to arbitration as to the rent payable for the holding, and in certain other cases. This right of the tenant, as well as his right to compensation for improvements, cannot be excluded by agreement.

(*c*) Any question or difference arising out of any claim by the tenant of a holding against the landlord for compensation under the act, or any claim by the landlord for breach of contract, and any other question or difference between the landlord or tenant arising out of the termination of the tenancy must necessarily be referred to the decision of a single arbitrator, who has the power of stating a case for the opinion of the county court on any question of law arising in the arbitration, but whose decision otherwise is final.

(*d*) Any engine, machinery, fencing or other fixture, and any building which the tenant affixes or erects without being obliged to do so, may be removed by an outgoing tenant unless the landlord (to whom notice must be given) elects to purchase them at a fair value to an incoming tenant.

(*e*) A notice to quit a holding coming under the act and held on a yearly tenancy will be void if it purports to terminate this tenancy before the expiration of twelve months from the end of the then current year of tenancy, but there is exempted from this enactment notice given under a provision in the contract of tenancy authorising the resumption of this holding or part of it for a specified purpose not being the use of the land for agriculture. Even in the case of leases for two years and upwards the tenancy will not terminate on the expiration of the term unless at least one year's notice to terminate the tenancy has been given, and if no such notice is given the tenancy will continue as a yearly tenancy. On the making of any contract for sale of a holding or part of a holding, any then current and unexpired notice to determine the tenancy given to the tenant, if the contract for sale is made by the person by whom the notice to quit is given, is made null and void. Notwithstanding any custom of the country or agreement to the contrary, a tenant is entitled to practise any system of cropping of arable land on his holding, and to dispose of the produce of the holding, as he thinks fit. He is bound, however, to exercise his rights so as not to deteriorate the holding in any way, and during the last year of his tenancy he must comply with the terms of his agreement or the custom of the country.

(*f*) In the case of holdings coming under the act, the right to distrain is limited to one year's rent. Live stock taken in to be fed at a fair price are exempted from distress, if other sufficient distress is to be found, and cannot in any case be distrained for a sum exceeding the amount remaining due from the owner for the price of feeding. Hired machinery, and live stock belonging to another person which is on the premises solely for breeding purposes, may not be distrained at all.

(*g*) The third schedule to the act contains a list of improvements likely to be made on market gardens which comprises the planting of standard or other fruit trees, the planting of fruit bushes, strawberry plants, and asparagus, rhubarb, and other vegetable crops which continue productive for two or more years, and the erection or enlargement of buildings for the purpose of the trade or business of a market gardener. If it has been agreed in writing that the holding shall be let or treated as a market garden, the tenant may obtain on quitting compensation for any of these improvements made by him without the previous consent of his landlord. Moreover, if a tenant is desirous of making any of these improvements and the landlord refuses to agree that the holding shall be let or treated as a market garden, the tenant may apply to the County Agricultural Committee for the area in which the holding is situate, and they may direct that the provisions of the act as to market gardens shall apply, but in that case if the tenancy is terminated by notice to quit from the tenant he will be entitled to obtain his compensation from an incoming tenant and not from the landlord, unless the latter refuses to accept a substantial and suitable person willing to pay the compensation and accept a tenancy on conditions similar to those under which the outgoing tenant held.

The act does not apply to Scotland, for which country a similar act was passed in the same year. A. J. S.

AGRICULTURE AND FISHERIES, MINISTRY OF. The Ministry of Agriculture and Fisheries was constituted pursuant to the

Ministry of Agriculture and Fisheries Act 1919, which amended the Board of Agriculture and Fisheries Acts 1889 to 1909. Under the Small Landholders (Scotland) Act 1911, all functions of the Board of Agriculture and Fisheries, so far as Scotland was concerned, had been transferred to a separate Board of Agriculture for Scotland except the administration of the Diseases of Animals Acts. Powers and duties of both the Board of Agriculture and Fisheries, and the Board of Agriculture for Scotland, in relation to forestry were transferred in 1919 by the Forestry Act 1919 to the Forestry Commissioners.

The Ministry of Agriculture and Fisheries has had no jurisdiction in Ireland except in relation to the Ordnance Survey, and these functions were transferred to the respective Governments of Northern Ireland and the Irish Free State in 1922.

The jurisdiction of the Ministry includes the Royal Botanic Gardens, Kew.

The Ministry is presided over by a Cabinet Minister—the Minister of Agriculture and Fisheries—who is responsible to Parliament for its policy and operations. Among the Acts administered by the Ministry are the Fertilisers and Feeding Stuffs Act 1906, the Butter and Margarine Act 1907, the Smallholdings and Allotments Acts 1908-1919, the Allotments Act 1922, the Sale of Food and Drugs Acts so far as they relate to articles affecting the interests of agriculture, Tithe Acts 1836-1918, Diseases of Animals Acts 1914-1922, and the Destructive Insects and Pests Acts.

[See BOARD OF AGRICULTURE.] C. R. W.

ALIEN IMMIGRATION. By the Aliens Act, 1905, it is enacted that no "immigrant" as defined in the Act shall be landed in the United Kingdom from an "immigrant ship" (also there defined), except at a port at which there is an immigration officer appointed under the Act, or shall be landed at any such port without the leave of that officer given after an inspection of the immigrants made by him on the ship, and that the immigration officer shall withhold leave in the case of any immigrant who appears to him to be an "undesirable immigrant," as therein defined; but that the Secretary of State for the Home Department may, subject to such conditions as he thinks fit to impose, make "exemption orders," relieving particular immigrant ships from the abovementioned provisions, if he is satisfied that a proper system is being maintained for preventing the embarkation of undesirable immigrants on these ships, or if security is given to his satisfaction that undesirable immigrants will not be landed in the United Kingdom from those ships except for the purpose of transit; and he may also, if he thinks fit, make "expulsion orders," requiring particular aliens to leave the United Kingdom within a time fixed by the order, and thereafter to remain out of the United Kingdom on certain prescribed facts being proved in a certain prescribed manner. The expression "immigrant" is defined as meaning an alien steerage passenger (not being a "transmigrant"), who is to be landed in the United Kingdom, and the expression "steerage passenger" as including all passengers except such persons as may be declared by the Secretary of State to be "cabin passengers," by order made either generally or as regards any special ships or ports. Pursuant to the Act, the Secretary of State has made numerous exemption orders relieving second-class passengers from inspection, upon the shipowners giving security by bond not to land any undesirable immigrants from among such passengers, and has also made a general order declaring all such passengers as are entitled to use the cabins, state-rooms, or saloons, where the accommodation is superior to that provided in any other part of the ship devoted to the carrying of passengers, to be cabin passengers for the purposes of the Act (Aliens Act, 1905). It appears from the parliamentary return showing the result of the first year's working of the Act, that for the twelve months ending 31st December 1906, out of a total of 465,500 alien passengers, 493 were finally refused leave to land, and expulsion orders were made in 287 other cases. And it appears from the first annual report of H.M. Inspector under the Act that, after making the necessary deductions for cabin passengers, exempted second-class passengers, transmigrants, and others who are not within the Act, only 38,527 of the 465,500 alien passengers are left unaccounted for. Of these, 22,986 were males, 11,049 females, and 4492 children. Russians and Poles numbered 12,832; French, 10,116; Italians, 5360; Germans, 3186; Norwegians, Swedes, and Danes, 1295; Austrians, Hungarians, and Bohemians, 1223; Swiss, 983; Dutch, 798; Spaniards and Portuguese, 572; Americans (U.S.), 552; Belgians, 380; and other nationalities, 1230. The total number of aliens who received Poor Law relief during 1906 in London and certain provincial unions was 6050, and the number sent to lunatic asylums was 266. As pointed out in the report, the statistics of convicted prisoners already yield indications that the liability to expulsion created by the Act is exercising considerable influence. For the alien prison population, which had reached its highest point in 1904, having increased ever since 1893, and at a greater rate than the total prison population, suddenly dropped in 1905 by 7·01 as compared with a fall of only 1·12 per cent in the total number of prisoners, and this change, which is suggested to have been due to the shadow of the coming Aliens Act, was continued and accelerated in 1906, the first year of the operation of the

Act, when the total number of convicted persons received into prison fell by 6·32 per cent, while the number of aliens among them fell by 16·85 per cent, leaving the proportion of aliens to the total number at 1·85 per cent, the lowest figure since 1899. (*Aliens Act, 1905, First Annual Report of H.M. Inspector under the Act, c. 3473.*) (*Parl. Papers, c. 3316 of 1907.*) T. G. S.

ALLOTMENT.* The Allotments Acts of 1887 (50 and 51 Vict. c. 48) and 1890 (53 and 54 Vict. c. 65) and the provisions regarding allotments contained in the Local Government Act 1894 (56 and 57 Vict. c. 73) and the Small Holdings and Allotments Act 1907 (7 Edw. VII. c. 54) were consolidated into the Small Holdings and Allotments Act 1908 (8 Edw. VII. c. 36). These Acts constituted an attempt to enable any suitable person of the labouring population to obtain access to a piece of land for cultivation in his spare time. The legislation was progressive in the direction of ensuring that authorities responsible for the provision of allotments, viz. the Borough, Urban District, and Parish Councils, and Parish Meetings, should possess powers of compulsory acquisition of land for use as allotments if they were unable to acquire by agreement, and that if the allotment authority of first instance did not carry out its duties, a higher authority, the County Council or the Board of Agriculture and Fisheries, could act in default. In 1914 the number of allotments in England and Wales was estimated at 580,000, with a total area of 130,000 acres.

The greatest extension of the allotment movement, especially in and around the cities and towns, came during the Great War in 1916 and 1917, after the threat of scarcity of food had been fully realised. Under the Defence of the Realm Regulations powers were taken by the Board of Agriculture and Fisheries to enter on land for the purpose of cultivation, with a view to maintaining the food supply of the country, and certain of these powers were delegated to Local Authorities for the provision of allotments. It is estimated that the number of allotments in England and Wales rose in 1917-18 to 1½ million, comprising over 200,000 acres, the large increase being almost entirely in the urban districts. With the view of maintaining the movement after the war, certain provisions of the Land Settlement (Facilities) Act 1919 (9 and 10 Geo. V. c. 59) assisted in the acquisition of land for allotments, and gave additional powers of letting to County Councils. The Act also removed the restriction confining the provision of statutory allotments to the labouring population. In 1920, the estimated number of allotment holders in England and Wales was 1,330,000 (Annual Report, Ministry of Agriculture and Fisheries, H.M. Stationery Office, 1921). With the near approach of the termination of the War Emergency Legislation, a Departmental Committee on Allotments was appointed in 1921, and as a result of their report (H.M. Stationery Office, 1922), the Allotments Act 1922 (12 and 13 Geo. V. c. 51) was passed, which contained provisions enabling urban local authorities to enter on unoccupied land without the owner's consent, for the purpose of providing small allotments. The Act also provided that, in the large cities and towns, the local authority should set up an allotments committee, comprising non-members of the Council representative of the interests of allotment holders. The Act also enabled costs of acquisition of land and sinking fund charges in respect of loans for the purchase of the land, to be met out of the rates, and settled the basis of compensation for crops and unexhausted manures to allotment holders on dispossession. For the first time in allotments legislation, restrictions were imposed by the Act on the right of landlords to terminate the tenancies of allotment gardens, whether let direct by them, or through the Local Authority, the Act being based apparently on the contention that this interference with private interests was justified by the national importance of providing garden plots for the dwellers in urban districts with some security of tenure to enable the plot-holders to reap the reward of their labours.

Under modern conditions allotments can be divided into two classes, the small allotment or allotment garden, worked by a resident in a town or village for the production of vegetable and fruit crops for consumption by himself or his family, and the larger parcel of land by which the rural labourer seeks to add to his earnings by keeping pigs, poultry, etc., and selling surplus produce. The total number of allotment holders in England and Wales in 1923 was estimated to be 1,190,000 (Annual Report, Ministry of Agriculture and Fisheries, 1924). In the urban districts of England and Wales they are well organised by means of societies and federations affiliated to a national union, and are now in a position to exercise a considerable amount of political influence. As to the social and economic advantages of allotments, see in particular the Report of the Departmental Committee, 1922, quoted above. (For an account of the present law, see *The Law of Allotments and Allotment Gardens*, E. Lawrence Mitchell, Third Edition, London, 1922.) E. L. M.

ALLOY.* Since the war, silver alloys of low fineness have been used in the coinage in a number of countries. In 1920 England reduced the standard of silver coin to 500, and France, Italy, Germany, and some other countries have ceased to coin silver. Japan,

Holland, and Mexico have adopted the standard of 720. On the other hand the United States have maintained the standard of 900, and India that of 916·6.

According to the experience of the past, silver coins of low standard have not been satisfactory, owing to rapid tarnishing and corrosion in circulation. It is now known that the wear of coins is a function less of simple abrasion, which depends on hardness and toughness, than of atmospheric corrosion followed by attrition, which depends on composition. It follows that coinage alloys of silver of low standard are not likely to be durable in circulation, in which the coins are subjected to oxidation and attack by acids contained in the air of towns and by the acids of grease. The results caused low standard silver for coins to be abandoned generally, the last nation to come into line being Germany in 1871. The only exceptions remaining were certain small subsidiary coins in Russia, Scandinavia, Holland, and China. It remains to be seen whether the lower standards adopted since the war will stand the test of time. So far, in England, the coins of the 500 standard have tarnished when stored and have become gradually cleaner when in active circulation. Their rate of wear is not yet known. T. K. R.

AMERICAN SCHOOL OF POLITICAL ECONOMY.* The development of economic thought in the United States has been unattended by "an alliance of persons, a community of ideas, an acknowledged authority and a combination in purpose" (Higgs, *Physiocrats*, 3)—the earmarks of a scientific school.

The ardent protectionism of the '20's, centring in the Harrisburg Convention (1827), won from Friedrich List, in designation of the rebound from Adam Smith's "cosmopolitanism," the term "American Political Economy" (M. E. Hirst, *Friedrich List*, 1907). Similarly, the economic optimism of Henry C. Carey, with its thorough-going rejection of the Ricardian theory of rent, the Malthusian principle of population and the wider implications of the classical political economy, has been described as meriting "with more propriety the term American school" (Taussig, *American School of Political Economy*, *supra*, p. 38). but List's phrase obviously points to an episode in political history rather than to a movement in political economy (Taussig, *supra*); and Carey's service was penetrating criticism, inspired by local and temporary conditions, rather than constructive doctrine or enduring influence.

It is clear, nevertheless, that the distinctive features of American economic environment, political structure, social composition, and educational method have exerted definite impress upon economic thought and writing in the United States. In this sense there is warrant for the term "American School."

1. Colonial Period (1607-1776). Economic opinion found expression in the early life of the American plantations in open discussion, legislative debate, pulpit utterance, and newspaper controversy. Economic problems were limited and localised, and intellectual life drew sustenance from the Old World. There was no counterpart to the mass and variety of English seventeenth and eighteenth century economic writing. Nothing remotely approaching a treatise appeared, and the pamphlet literature consists of a handful of tracts evolved by the motley currency ventures of New England, Pennsylvania, and the Carolinas, together with scattered issues on trade, taxes, and husbandry, and random allusions in current historical and political writings.

A single exception was William Douglas—"the honest and downright Doctor Douglas" (*Wealth of Nations*, bk. ii. chap. 11)—a native of Scotland who settled in Boston in 1718, and thereafter wrote informative pamphlets upon the economic affairs of the colonies, particularly as to monetary policies. Adam Smith drew repeatedly upon Douglas' *Summary of the British Settlements in North America* (1755) for particulars as to the paper currencies of the colonies, and M'Culloch —although unacquainted with its authorship —reprinted, as the first of his *Scarce and Valuable Tracts on Paper Currency* (1857), Douglas' *Discourse concerning the Currencies of the British Plantations in North America* (1751), as of "the highest excellence."

2. National Beginnings (1776-1812). In the generation that saw the birth of the new republic, the outstanding exponents of economic opinion, as of political thought, were Benjamin Franklin, Thomas Jefferson, and Alexander Hamilton. Of these, Franklin, "the first American who deserves to be dignified by the title Economist" (Wetzel, *Benjamin Franklin as an Economist*, 1895, p. 56), had already won distinction as philosopher and man of letters before his first foreign mission in 1757-62 as agent of Pennsylvania. His economic opinions were set forth in tracts evoked by current controversies and in familiar precepts as to personal and social conduct. In *Nature and Necessity of Paper Currency* (1729) the neo-mercantilist contention inspired by Petty and destined to receive its quietus a few years later from David Hume, that "a plentiful currency will make rates of interest low and will promote immigration and home manufactures," supported the colony's policy of further paper emissions. Franklin records naïvely that his political friends "who considered I had been of some service thought fit to reward me by employing me in printing the money, a very profitable job and a great

help to me." Parliamentary opposition to colonial manufactures, culminating in Townshend's committee of inquiry and the restrictive measure of 1750, evoked *Observations concerning the Increase of Mankind and the Peopling of Countries* (1751), wherein Franklin urged that the vast area of cheap land, relative to the maximum increase of population, would prevent the American colonies from competing industrially with the mother country. Curiously enough, like Malthus' *Essay on Population*, of which it was the prototype, the major thesis was less influential than the supporting arguments. Adam SMITH adopted Franklin's estimate of the rate of increase of population in the American colonies; MALTHUS requisitioned illustrative material and received suggestion or encouragement as to the effect of a higher standard of life serving as a preventive check; GODWIN grumbled that "a great name goes with me for nothing." Franklin's largest influence as an economic thinker and social philosopher was exerted during this period by the homely maxims and common-sense homilies as to "the art of virtue" appearing year after year in *The Pennsylvania Gazette* and *Poor Richard's Almanack*, of which he was editor and publisher. It was this, like Hume's *Moral Discourses*, which won him prestige at home and recognition abroad. The later phase of Franklin's economic career grew out of European contacts. From 1757 to 1775, barring a brief return to America in 1762, he resided abroad as agent of the colonies. Philosophical circles and literary coteries vied in honouring him. In England he met Lord Kames, Dr. Robertson, David Hume, and Adam Smith, and spread knowledge of the problems and aspirations of the colonies, supported by economic reasoning always intelligible and rarely unsound. In Paris he associated with Quesnay, Mirabeau, Du Pont, and Turgot, and carried back to America the impress of their tenets, while perhaps giving something in exchange.

Primarily jurist and publicist, Thomas Jefferson's interest in the educational value of economic principles and his appreciation of the importance of their wide diffusion in a democracy, were more significant than his positive contribution. As a youth "the acquaintance and familiar table" of Governor Francis FAUQUIER may be supposed to have stirred his interest in economic doctrine in relation to colonial grievances. Exchanging legal practice for political activity and becoming a central figure in the struggle with England and in the formative period which succeeded, economic problems engaged him, even though judicial reform, political structure, educational organisation were his more evident tasks. As in the case of Franklin, residence in Paris (1784-89) and contact with the leaders of economic thought, Morellet, Turgot, Lafayette, Du Pont de Nemours, and Destutt de Tracy, profoundly influenced Jefferson. In particular, Tracy's strictures upon Montesquieu appealed to him. At his suggestion Tracy in 1798 wrote a commentary upon *The Spirit of Laws*, which Jefferson, ex-President and "sage of Monticello," translated and published in Philadelphia in 1811. So, too, in 1813 Tracy sent the manuscript of his *Treatise on Political Economy* to Jefferson, who induced Duane to translate and Milliken to publish it.

As Franklin gave popular currency to economic principles and Jefferson made familiar the scope and purpose of economic science, so Alexander Hamilton left enduring impress upon the economic institutions of the young republic (Harrower, *Alexander Hamilton als Nationalökonom*, 1887). A veritable prodigy in the variety and quality of his youthful performances, he threw himself into the Revolutionary struggle, serving as confidential aide to Washington and later winning distinction in field command. Acquaintance with economic and financial texts was tested by service as continental receiver for taxes for New York and as a member of Congress and by legal practice. He made deliberate study of Adam Smith, and is said to have written "an extended commentary"—unfortunately not preserved—on the "Wealth of Nations" (Bourne, "Alexander Hamilton and Adam Smith," in *Quarterly Journal of Economics*, viii. 328). In 1789, upon the inauguration of the new government, Hamilton, then in his thirty-second year, became secretary of the treasury in Washington's cabinet, Robert Morris—the financier of the Revolution—declining the post on the ground that Hamilton was the "man best fitted to meet its problems." In the six years of incumbency Hamilton fairly established the financial basis of the republic by a series of state papers, for the most part promptly translated into practice. His genius in adapting sound principles and tested devices of public finance to the needs of the young country (Dunbar, "Some Precedents followed by Hamilton" in *Quarterly Journal of Economics*, iii. 32) ranks his financial achievement with the military talent of Washington and the judicial capacity of Marshall. As fiscal administrator he introduced sound practices of accounting into the exchequer. His report on Public Credit (1790) led to the rehabilitation of the republic's borrowing power. The paper on a National Bank (1790) resulted in the creation of the Bank of the United States. The report on Establishment of a Mint (1791) defined the monetary system of the country. The report on Encouragement and Protection of Manufactures proved an arsenal of arguments for a national protective system. In all of these particulars, economic establishments were

justified by able reasoning tinctured by practical wisdom.

The economic aftermath of the War of Independence evoked numerous pamphlets, a few, like Pelatiah WEBSTER's *Nature and Operation of Money* (1791), S. Gale's *Essays on Public Credit* (1784), and Tench COXE's *View of the United States* (1794), ranking as substantially more than tracts of the time.

The standard set by Hamilton in the Treasury was sustained by Oliver Wolcott, and conspicuously by Albert GALLATIN. As publicist and anti-Federalist, Gallatin had won recognition in fiscal matters by his *Sketch of the Finances of the United States* (1796) and his *Views of the Public Debt, Receipts and Expenditures* (1800), and by insistence upon directness and economy in public financing. When Jefferson assumed the presidency, Gallatin was summoned to the Treasury. "Wise, prudent, and conservative, Gallatin made few changes in Hamilton's arrangements, and for twelve years administered the national finances with the greatest skill" (Henry Cabot Lodge in *Ency. Brit., sub nom.*). Retiring from public life in 1827, to become an influential figure in American banking, his continuing interest in financial principles appeared in *Considerations on the Currency and Banking Systems of the United States* (1831), and *Suggestions on the Banks and Currency of the several United States* (1841), urging the maintenance of specie payments; and in *Memorial of the Free Trade Convention* (1832) presenting the arguments in favour of free trade. As an economist Gallatin probably ranks higher than Hamilton, though not as a constructive statesman.

3. INTERNAL DEVELOPMENT (1816 - 61). The Treaty of Ghent left the Republic secure from foreign involvement and free to work out its own economic development. The doctrinal counterpart was an ineffectual challenge of the transplanted classical political economy by a native economic philosophy reflecting the immediate environment—together with widening and more competent monographic treatment of current economic affairs.

The infiltration of European economic thought, in particular of the French post-physiocratic group and of the English classical school, was hastened by Jefferson's patronal support of American translations and reprints and by the enterprise of Georgetown, Philadelphia, and Hartford publishers. An American edition of the *Wealth of Nations* had appeared as early as 1789 (a second reprint in 1811, and a third in 1818), and of Godwin's *Political Justice* in 1796. In 1809 Malthus' *Essay on Population* (3rd edition) was reprinted, and in 1831 the *Additions* to the Essay. Ricardo's *Principles of Political Economy* was reprinted in 1819, despite Jefferson's warning to the publisher that "the reputation of the work will, I think, fall as soon as it comes to be read." Destutt de Tracy's *Montesquieu* appeared in 1811 and his *Political Economy* in 1817. A translation of Say's *Traité* was printed in 1821 and a second edition, with introduction and notes, by Clement C. Biddle, in 1824. Mrs. Marcet's *Conversations* was reprinted in 1817 and again in 1828, and M'Culloch was edited by M'Vickar in 1825.

In train of these reprints followed a series of manuals, written often by clergymen, ordinarily as college text-books, and in the main paraphrasing the current doctrines of the English school. Thomas COOPER, the English radical, as professor of chemistry and political economy at South Carolina College, published his *Lectures on the Elements of Political Economy* in 1826 and his *Manual of Political Economy* in 1834. John M'Vickar, already referred to, issued from his chair of philosophy and political economy at Columbia College *Outlines of Political Economy* (1825) and *First Lessons in Political Economy* (1835). Samuel Phillips Newman lectured on political economy at Bowdoin College and wrote *Elements of Political Economy* (1835) —"little more than a compendium of ideas, somewhat ill digested, gained from a reading of *The Wealth of Nations*." Henry VETHAKE's *Principles of Political Economy* (1838) embodied the substance of class lectures delivered at the colleges with which he was successively connected. More important in circulation and influence was Francis WAYLAND, theologian and for a generation president of Brown University, whose *Elements of Political Economy* (1837) found wide acceptance as a college text-book up to and even after the Civil War.

Dissent from the doctrines of the ENGLISH SCHOOL first appeared, reflecting Alexander Hamilton's influence, in advocacy of protectionism. Matthew CAREY, who had emigrated from Ireland for political reasons and established himself in Philadelphia as a successful journalist and publisher, became a prolific writer on economic matters and, from 1820 on, "the most active among the advocates of protectionism in the United States." As president of the Pennsylvania Society for the Promotion of National Industry, as patron and sponsor of Friedrich List and Daniel Raymond, and as author of economic pamphlets and political tracts (J. W. Jenks, *Henry C. Carey als Nationalökonom*, 1885), Carey did much to cast doubt upon the local applicability of the English classical doctrines.

The first substantial treatise to show an intellectual independence begotten of American conditions was Daniel Raymond's *Elements of Political Economy* (1820; 2nd edit., 2 vols., 1823). A briefless member of the Baltimore

bar, Raymond sought relief from tedium "in putting on paper some of my thoughts on political economy" as "an humble effort to break loose from the fetters of foreign authority; from foreign theories and systems of political economy, which, from dissimilarity in the nature of the governments, renders them altogether unsuited to our country" (Preface). Acquainted with the writings of the English school and influenced appreciably by Lauderdale's work, Raymond's purpose was not to restate the general body of economic principles, but to establish a doctrinal basis for his bitter hostility to the practical applications of the classical economics. Antagonism to the prevailing individualistic philosophy, economic and political, pervaded his system—"it leaned to governmental interference in opposition to *laissez faire*, stood for protective tariffs, decried banks and paper money, and hurled anathemas at slavery as an economic evil" (Neill, *Daniel Raymond*, 1897). Raymond's book attracted some attention and enjoyed moderate circulation, a third edition being issued in 1836 and a fourth in 1840. Matthew Carey's admiration went to the length of offering to maintain a professorship of political economy at the University of Maryland, of which Raymond was to be the incumbent. Whether Friedrich List derived direct suggestion from Raymond remains a moot question, with the weight of probability inclining to the affirmative (Neill, *op. cit.* chap. iv.).

Resistance to the classical doctrines of population and rent, in the light of American conditions, appeared in A. H. Everett, *New Ideas on Population* (1823); in I. N. Cardozo, *Notes on Political Economy* (1826); in Willard Phillips, *Manual of Political Economy* (1828). In 1829, T. R. Dew, professor and later president of William and Mary College, published *Lectures on the Restrictive System*, delivered to "the Senior Political Class" of the College. In the succeeding decade, renewed qualification of the English classical doctrines appeared in A. Potter, *Political Economy: Its Objects, Uses, and Principles* (1840)—described by Seligman as "largely an adaptation of Poulette Scrope"; in N. A. Ware (*A Southern Planter*), *Notes on Political Economy* (1844); in Calvin Colton (in later life professor of political economy at Trinity College, Hartford, Connecticut), *Public Economy for the United States* (1848); and in George Opdyke, *Treatise on Political Economy* (1851). John Rae's *Statement of Some New Principles on the Subject of Political Economy* (1834) avowed the author's deep "conviction of the unsoundness of the system maintained in the *Wealth of Nations*." Rae presented an acute theory of capital and an effective defence of the protective system, and his work was cited by J. S. Mill and Hearn (reprinted in 1905, with biographical sketch and notes, by C. W. Mixter).

The outstanding figure in the "nationalist" group was Henry C. Carey. No other American economist, with the possible exception of Francis A. Walker, has exercised so wide a doctrinal influence or left so definite an impress upon the development of the science. The son of Matthew Carey (*supra*), he retired from business in mid-life to devote himself to economic speculation. In 1835 appeared *Essay on the Rate of Wages*, followed by *Principles of Political Economy* (1837-40); *The Past, the Present, and the Future* (1848); *The Harmony of Interests* (1850); *Principles of Social Science* (1858-59). "Carey started out as a free trader, but soon became an ardent protectionist and took issue at almost every point with the doctrines of the classical school. He opposed Adam Smith on the theory of productive labour; he objected to the Ricardian theories of rent and wages; he criticised the Malthusian theory of population; he laid stress on his own law of value and utility; and he elaborated, on original but none the less secure foundations, a whole structure of economic thought. At a time when the field was occupied by the American imitators of British classical political economy and by the widely read translation of Bastiat, the French free trader, Carey heartened all those both at home and abroad who were seeking some economic basis for the newer nationalism with its policy of protectionism" (Seligman in *Cambridge History of American Literature*, vol. iv.),

Current economic issues evoked a mass of descriptive and controversial literature, much of it ephemeral but marked on the whole by increasing competence. The labour movement, Fourierism, the tariff controversy, banking and currency policies were the important subjects of discussion. In 1839 the American Statistical Association was founded, synchronising with this new spirit.

The economic aspects of slavery interested such writers as Dew, Harper, Ruffin, Helper, and Olmsted.

4. Transition (1861-76). The declining interest in political economy in England in the post-classical period found its counterpart in the United States in mid-century stagnancy. The "nationalistic" spirit had shot its bolt; Mill's *Principles*, immediately reprinted and widely circulated in the United States, was accepted as doctrinal finality; tariff, currency, and banking controversies had yielded to sectional debate; positive inquiry was dormant, and such interest as appeared was appeased by text-books designed primarily for college use.

George Tucker, who held the professorship of moral philosophy and political economy

in the University of Virginia from 1825 to 1845, and who had dissented acutely from the Ricardian doctrines in *Law of Wages, Profits and Rent Investigated* (1837), continued to exercise influence in the South through his *Political Economy for the People* (1859). In Philadelphia the interest in economic studies, which Matthew and Henry C. Carey had aroused, was sustained by the contributions of William Elder, E. Peshine Smith, Robert Ellis Thompson, and Stephen Colwell. A. L. Perry taught political economy at Williams College, and wrote primarily for class-room use *Elements of Political Economy* (1865) and *Introduction to Political Economy* (1877). Accepting with some variations the doctrines of the English school and recording the great influence exerted upon him by Bastiat's *Harmonies* ("I had scarcely read a dozen pages in that remarkable book when the field of the science in all its outlines and landmarks lay before my mind just as it does to-day"), Perry's manuals, distinguished by clearness of expression and simplicity of exposition, were widely read and studied. Francis Bowen, editor, man of letters and for many years professor at Harvard, embodied the substance of pamphlet writing and class-room lecturing in *Principles of Political Economy* (1856). Reprinted many times (in 1870 under the title *American Political Economy*), Bowen's work, with Tucker's, Wayland's, Vethake's, and Perry's, continued for a generation the familiar texts of economic instruction in the United States. Perry's successor at Williams was John Bascom, whose long academic career included economic manuals (*Political Economy*, 1859; *Social Theory*, 1895), clearly exhibiting "the college professor who was devoted to theology and philosophy, acquired his knowledge and bent in economics from the classical texts rather than from a touch with practical affairs" (Turner, *op. cit.* 178). In sharp contrast was the work of his friend and admirer Amasa Walker (*The Science of Wealth*, 1866). Viewing political economy as "emphatically a business science," Walker's book was "little more than a comprehensive treatise of money and finance." A naïve sentence of the preface to an abridged edition (1872) "for popular reading and use as a text-book," illumines the current state of the science: "Although desirable that the instructor should be familiar with the subject himself, it is by no means indispensable. With a well-arranged text-book in the hands of both teacher and pupil, with suitable effort on the part of the former and attention on the part of the latter, the study may be profitably pursued. We have known many instances where this has been done in colleges and other institutions, highly to the satisfaction and advantage of all parties concerned" (Preface, vii.; quoted in R. T. Ely, *The Past and the Present of Political Economy*, 1884).

In the decade (1865-75) following the close of the Civil War economic thought and writing centred about lay discussion of problems of financial and industrial reconstruction. Influential in developing the internal revenue system of the country, David A. Wells emphasised the great economic changes impending. The same note of optimism was struck by Edward Atkinson. Sound views on currency and banking were expressed by Horace White. In all of these the dominant quality was intimacy with contemporary detail and absorption in current problems rather than interest in historical development or concern with general principles. Scientific traditions were courageously sustained in a few professional chairs where economic instruction had broken from the time-honoured formulae. At Yale, William G. Sumner lectured on the history of protection and projected the perilous state of the American currency against the English restriction experience. At Harvard, Charles F. Dunbar initiated fruitful studies of the financial history of the United States; at Johns Hopkins, Simon Newcomb, the astronomer, pursued financial and economic studies as an avocation, culminating in *Principles of Political Economy* (1886). Evidence of growing interest in the formal science appeared in a partial translation (1878, 2 vols., ed. John J. Lalor) of Roscher's *System der Volkswirtschaft*; in a translation (1880, preface by David A. Wells) of Blanqui's *Histoire de l'économie politique en Europe*, and in a three-volume *Cyclopaedia of Political Science and Political Economy* (1883; ed. by John J. Lalor).

More notable than all of the foregoing as an exhibit of environment modifying doctrine was the work and influence of Henry George. Unscientific in method and extravagant in conclusion, no other American thinker has exercised so much influence upon economic thought and action in this country and abroad. Living in California at a time when valueless land was swiftly acquiring sensational site value with increasing population, George, first in *Our Land and Land Policy* (1871), and more fully in *Progress and Poverty* (1879), presented a closely integrated, eloquently phrased economic philosophy, wherein wealth was imputed to the growth of land value, and release was proposed by the public appropriation of the "unearned increment."

5. Modern Phase (1876-1924). The centenary of the Declaration of Independence (1876) marked, appropriately enough, the passing of an old and the beginning of a new era in economic affairs as in political growth. Railroad construction attained transcontinental proportions; capitalism foreshadowed its modern

stride ; the free land of the West was in sight of exhaustion ; falling prices were accentuated by resumption of specie payments and demonetisation of silver ; labour unrest culminated in the great strike of 1877. (Cf. Seligman, *op. cit.*)

The result was to direct attention to fundamental economic principles. In 1876, in reviewing the progress of economic science in the United States in the century elapsed, DUNBAR admitted (*North American Review*, January 1876): "The United States have, thus far, done nothing toward developing the theory of political economy, notwithstanding their vast and immediate interest in its practical applications"—a judgment in which Cliffe LESLIE four years later concurred (*Fortnightly Review*, October 1880) in declaring "American political economy is in the main an importation from Europe, not an original development ; it has made but slight inductive study of surrounding phenomena, and follows, for the most part, the method of deduction from general assumptions ; it has hardly attempted to investigate the laws of evolution of which the present economic structure and state of American society are the outcome."

The new spirit of inductive study of surrounding phenomena first showed itself in the work of Francis A. WALKER, Professor of Political Economy in the Sheffield Scientific School of Yale College, and Director of the Census of 1870 (later, also, that of 1880), and took the form of a brilliant restatement of the relation of labour and capital. The WAGE FUND theory had held sway in the United States as in England, with at best inarticulate and unavailing dissent, for the two generations following RICARDO. The reaction which had shown itself in England in Longe's indictment in 1866, in Cliffe Leslie's criticism in 1868, in THORNTON'S attack in 1869, and in MILL'S ponderous recantation in the same year, had exhausted itself in the United States in "patched and revamped versions." In a brilliant essay on "The Wage Fund Theory" (*North American Review*, January 1875) Walker finally disposed of this recrudescence, and a year later in *The Wages Question* (1876) differentiated, with convincing detail, the *entrepreneur* as an economic functionary from the capitalist, and analysed the composite profit of the prevailing theory of distribution into two elements, each subject to independent determination.

Walker's competence won further academic recognition by appointment in 1876 as the first lecturer on political economy in the new Johns Hopkins University. The substance of his course appeared in 1878 as a treatise on *Money*, and in briefer form in *Money in its Relation to Trade and Industry* (1889), prepared as Lowell Institute lectures. Recognised widely now as a virile and independent thinker, Walker, in his *Political Economy* (1883) and repeatedly thereafter, with a precision of language and an abundance of detail, presented a new theory of distribution in replacement of the one whose mainstay he had so completely destroyed (Hollander, "The Residual Claimant Theory of Distribution" in *Quarterly Journal of Economics*, February 1903).

More notable even than this reflex of doctrinal controversies among English economists, and the tonic influence of extraordinary changes in American organisation, was the return to the United States in the early 'eighties of a remarkable company of young scholars from post-graduate study in German universities. Their arrival and activity effected a virtual renascence in American economic study. The dominant characteristics of the group were an avowal of the historical-inductive method and an election, in the main, of concrete problems for inquiry. With others trained in this country lodgement was found in leading universities ; student bodies gathered, and productive scholarship developed. (Cf. *Science Economic Discussion*, 1886.)

At Harvard, Taussig traced the growth and influence of American protectionism ; at Yale, Hadley concerned himself with railway transportation, and Farnam with social problems ; at Columbia, Seligman studied the theory and practice of taxation, and Mayo-Smith pursued statistical inquiries ; at Johns Hopkins, Ely made pioneer studies of local taxation and of the labour movement ; at Michigan, H. C. ADAMS became identified with fiscal studies ; at Pennsylvania, Patten developed a theory of consumption, and James studied municipal economics ; at Bryn Mawr, Giddings devoted himself to social philosophy ; and at Smith and Amherst, Clark initiated brilliant speculations in economic theory.

The "historical movement" in the United States reached its high-water mark in the formation of the American Economic Association at Saratoga in 1885. A constitution was adopted with a "statement of principles" as follows : "(1) We regard the state as an agency whose positive assistance is one of the indispensable conditions of human progress. (2) We believe that political economy as a science is still in an early stage of its development. While we appreciate the work of former economists, we look not so much to speculation as to the historical and statistical study of actual conditions of economic life for the satisfactory accomplishment of that development. (3) We hold that the conflict of labour and capital has brought into prominence a vast number of social problems whose solution requires the united efforts, each in its own sphere, of the church, of the state, and of

science. (4) In the study of the industrial and commercial policy of governments we take no partisan attitude. We believe in a progressive development of economic conditions, which must be met by a corresponding development of legislative policy." To the foregoing was attached a footnote: "This statement was proposed and accepted as a general indication of the views and the purposes of those who founded the American Economic Association, but is not to be regarded as binding upon individual members."

In the organisation and early activity of the American Economic Association the extreme "historical" tendency in the United States spent itself. Stirred by militant challenge, heartened by clearness of issue, supplied with convenient channels of publication, the group of speculative thinkers to whom the work of ROSCHER, Cliffe Leslie, and INGRAM seemed emendatory rather than revolutionary, drew to the fore. The impulse took form in the founding of the *Quarterly Journal of Economics* in 1886, with Dunbar's fine inaugural on "The Reaction in Political Economy" sounding the keynote. The inevitable rebound developed. Included in the younger group were a quota—John B. Clark, Simon N. Patten, Franklin H. Giddings—inclined by habit of mind to deductive reasoning. Instinctively Francis A. Walker had been chosen as the first president of the American Association. Most of all, environment and contact begot tolerance and plasticity. MARSHALL'S *Economics of Industry* had appeared in 1879 and Walker's *Political Economy* in 1883, without appreciable effect. Now, however, Marshall's election to the chair of political economy, vacated by the death of FAWCETT, called attention to the novel elements in his doctrine; while Walker, aroused by SIDGWICK'S strictures, reiterated in incisive form the controverted elements of the "Wages Question." The publication of Marshall's *Principles of Economics* in 1890 marked the climax of the debate. With it, and the discussion immediately tributary, a lull was reached in economic controversy. (Cf. Hollander, "The Present State of the Theory of Distribution," in *Pub. Amer. Econ. Assoc.*, 1906.)

The economic scholarship of the next half-dozen years centred about the doctrinal contributions of Marshall and Walker. Not since Ricardo's time had such coherent theories of value and distribution been enunciated. The gap which the discrediting of the wage-fund theory had left was filled by attractive formulae, and recognition of the *entrepreneur* function and its reward interpreted the striking features of the new industrialism. But the respite was brief. The same year, 1890, in which Marshall's *Principles* was issued, the English translation of BÖHM-BAWERK'S *Capital and Interest* saw light—heralded indeed a year before by Bonar's admirable critique of the AUSTRIAN SCHOOL (*Quarterly Journal of Economics*, October 1888). In quick succession followed Böhm-Bawerk's *Positive Theory of Capital* and Wieser's *Natural Value* in English translation, with Smart's handy *Introduction* as a résumé. An outburst of controversial activity ensued, unparalleled in the history of American economic writing. During the 'nineties this sustained contest — exhibiting every variety of intellectual effort from stimulating analysis to hypercritical dialectic—raged about the Austrian doctrines. Through sheer exhaustion of disputants—and witnesses—the struggle had abated, when in 1899 Clark's *Distribution of Wealth* summarised with rare amenity of form the speculations of a profound philosopher and an inspiring teacher. The effects were wide conversion and ardent discipleship. For a decade Clark's doctrines dominated economic philosophy in the United States, weakening only with growing uneasiness as to the prematurity of speculative inquiries and with increasing resort to realistic studies. Walker, Böhm-Bawerk, Clark, thus constitute the major episodes in the thirty years of American economic speculation. There were minor doctrinal incidents—the debate over the scope and method of sociology in 1895-98, the discussion as to the order and form of economic instruction in 1912; but these stand in immediate relation to local and temporary events.

During this period positive inquiry was by no means absent. Governmental problems, national, state, and local, were taking on an increasing economic complexion with direct reflex upon student interest. Historical, institutional, and local investigations were carried on in graduate schools with energy. Doctoral dissertations extended over a widening range. Channels of publication multiplied and scientific assemblies became regular. Economic speculation, nevertheless, continued the prime interest and activity of American economists,

The familiar symptoms of scientific arrest had begun to show themselves in the first years of the century: the encouragement of commentation, the vogue of text-book writing, and the tolerance of metaphysical controversy as to final terms and ultimate concepts. Economic speculation, pursuing a dominantly deductive method, had come to be marred by the omission of verification, and more and more had partaken of the character of economic theorising (*cf.* Hollander, "Economic Theorising and Scientific Progress," in *American Economic Review*, March 1916, Supplement). Depression as to the state and tendency of the science was succeeded by conviction that political economy as pursued in the United States had been infected by unsound method,

that the productivity of scientific labour had been thereby impaired, and that a further diversion of energy into barren areas was threatened.

This consciousness found expression in a greater application to positive inquiry at the expense of speculative reasoning. At Johns Hopkins and elsewhere economic investigation deliberately took the form of the collection and analysis of actual economic data instead of the formulation of an abstract philosophy. Influenced by the methods of Booth, Webb, and Rowntree, came practical recognition—at first slight but rapidly increasing — that "research funds" are as essential to scientific activity in political economy as laboratory apparatus is to chemistry and clinical provision to medicine. (Cf. Hollander, "Economic Investigation in the United States," *Yale Review*, May 1903.)

As a generation before, startling changes in the nation's economic life took on compelling interest. With the greater specialisation of social effort, nation, state and city began to utilise the economist's counsel and to enlist his personnel to a new extent. This increasing requisition by public service, accompanied by sensational bidding up by private enterprise, had by 1914 so far dissipated the old seclusion that prospective scientific impoverishment rather than present public neglect constituted the economist's concern. In national affairs this had become physically manifest. The permanent Census Office, the reconstituted Department of Labour, the newly established Tariff Commission, the enlarged Department of Commerce, the reorganised Federal Trade Commission, the expanding Department of Agriculture, were so many stages in the economist's progress. Not always as expertly staffed as might be, hampered by political exigency, they reflected a widening infiltration. There were positive triumphs too. Workmen's compensation had become a part of our industrial scheme. Mediation and arbitration were finding use in a systematised form. Collective bargaining, at least as a phrase, had entered into business terminology. The income tax had been incorporated into the national revenue system. The theory of monopoly price was definitely accepted as to the regulation of non-competitive industry. The Federal Reserve Act had repaired the glaring defects in our banking organisation. The Federal Farm Loan project gave assurance that agricultural credit was to become available.

The entry into and part of the United States in the World War accentuated these tendencies. Problems of industrial mobilisation, of labour adjustment, of price-fixing, of revenue provision, of banking administration, emphasised the inadequacy of current economic information and the need of expert economic guidance. Even though at the outset there was no instinctive recourse to the economist on the part of public authority, and insufficient requisition of his equipment thereafter, yet services of importance and usefulness were rendered by almost every American economist.

In the post-Armistice period the American economist has become again alert scholar and diligent investigator, concerned primarily with positive inquiry but retaining keen interest in speculative studies (*cf. The Trend of Economics*, ed. Tugwell, 1924). The future of the science in the United States is thus full of promise. Compactly organised in scientific association, supplied as to assembled material and equipped as to technical journals, animated with high sense of public responsibility, established in academic office with large student groups affording apprentices and offering discipleship —the American economist has attained an honoured rank among scientists and come to fill a definite place in the nation's life. (Cf. Hollander, "The Economist's Spiral," in *American Economic Review*, March 1922.)

APPROPRIATION (Public Finance). The word appropriation is used in various senses in public finance. In the United States it signifies the amount granted by Congress for the service of a public department, and is employed by anticipation to designate what we call estimates. In this country the financial affairs of the session of Parliament are concluded by an Appropriation Act which allots to each department the sums voted for its use in Supply. The Appropriation Account, presented to Parliament by the Comptroller and Auditor-General, shows how the amounts so appropriated have been spent in each case, and comments upon any considerable divergence from the estimate. An Appropriation-in-aid is a sum received by a department (for example, fees, receipts from sales of stores, etc.) and not paid into the Exchequer, but used to reduce the amount of money which Parliament is asked to provide. If such receipts are likely to exceed the total expenses of the department, a nominal or token vote for say £10 or £100 is presented to the House of Commons in order that the department may not escape Parliamentary criticism and control. H. H.

ARBITRATION, International. One of the earliest methods for the settlement of disputes between individuals within an organised

society has been the voluntary submission of the parties to an arbitrator. This method has been adopted by civilised states ever since the IVth millennium B.C. when the kings of Lagash and Umma appointed the neighbouring king of Kish to act as arbitrator in the delimitation of the boundaries between their cities. After the break-up of the Roman Empire, the Catholic Church became the guardian of the public peace, and the Pope the arbitrator in the political disputes submitted to him by the princes of the new principalities, which were growing out of the Nordic tribal organisations. With the Reformation the Pope as arbitrator became impossible. Diplomacy took his place in the international relations of the modern states, and with their rise the modern law of nations came into existence. The agreements of diplomats based upon the principles of international law were embodied in treaties. The Treaty of Westphalia, 1648, recognised the new order. By this treaty the equality of states was recognised by the Christian Powers. A few years later the Cromwellian treaties of 1652, 1654, 1655, and 1656 provided for the appointment of arbitrators to adjust certain differences between the respective parties. This method was revived by the Jay Treaty of 1794 between Great Britain and the United States, and proved so successful in settling the disputes between the two countries as to convince the world of the advantages of arbitration. During the nineteenth century nearly two hundred instances are recorded of the submission of international disputes for settlement by arbitration, either to mixed commissions or to single arbitrators. In the majority of the earlier instances the disputes were not of a dangerous character. It was the Treaty of Washington of 1871, with the resulting *Alabama* Arbitration, which gave an immense impetus to the settlement of first-class disputes by voluntary arbitration. Thenceforth disputes of a grave character were referred to arbitration. Successful as this method proved, it was not, however, wholly free from defects. The *Alabama* case illustrates one peculiar weakness of this method. It was found necessary to settle beforehand in the Treaty of Washington what should be the law to be applied. The Three Rules of Washington were in fact *ex post facto* legislation. Great Britain was constrained to accept as law not what in fact it was at the time of the acts complained of, but what the American Government thought the law ought to have been. And generally, the creation of a special tribunal for each particular case, the selection of arbitrators or arbitrator, the agreement upon the procedure to be followed and the law to be applied, caused delay, embarrassment, and all sorts of difficulties. These defects the first Hague Peace Conference of 1899 sought to remove. By the Convention for the "Pacific Settlement of International Disputes" two methods of settlement were adopted, mediation and arbitration. To facilitate the latter—first, in differences not involving honour or vital interests, international commissions of inquiry may be constituted by special agreement between the parties; secondly, any dispute may be referred by agreement to the Permanent Court of Arbitration established by the Convention. As Art. 15 declares, "International Arbitration has for its object the settlement of differences between States by judges of their own choice and on the basis of respect for law." This Convention was ratified or adhered to by forty-four states. To ensure the better working in practice of the commissions of inquiry and tribunals of arbitration, and to facilitate recourse to arbitration in cases which permit a summary procedure, the Convention was revised by the second Hague Peace Conference of 1907. This was ratified or adhered to by only twenty-seven states. Consequently, certain states remain bound by the Convention of 1899. Each state appoints four persons of known competency in international law, who form the panel from which the arbitrators are selected. Failing agreement between the parties on the composition of the Court, each party appoints two arbitrators and these together choose an umpire. If they cannot agree, the choice of the umpire is entrusted to a third Power, selected by the parties. Failing such agreement, each party selects a different Power and the choice of umpire is decided by them. If this fails, by the Convention of 1907 the two Powers present two members from the panel from whom the umpire is selected by lot. The latter Convention also provides that one only of the two arbitrators selected by a party may be its national. The procedure adopted was that drafted by the Institute of International Law, but the parties, if they so desire, may adopt any procedure they please. Further, if the parties submit to arbitration they sign "a special act-*compromis*—in which the subject of the difference is clearly defined, as well as the extent of the arbitrators' powers." If the parties, however, so agree, the *compromis* may be settled by the Court. By the Convention of 1907, "generally speaking all the conditions on which the parties are agreed" may be defined in the *compromis*. The award is the opinion of all or of the majority of the arbitrators, and is accompanied by a statement of reasons. The agreement to arbitrate implies an agreement to abide by and to execute the provisions of the award. The award is final and without appeal, unless the parties have reserved the right to a revision. Critics of the Court have not been wanting. It has been said that it "is not permanent, because it is not composed of permanent judges; it is not accessible, because it has to be formed for each

individual case ; finally, it is not a Court, because it is not composed of judges." And it might be added it possesses no compulsory jurisdiction, the parties settle the issues to be determined, and sometimes the procedure to be followed and the law to be applied. If, indeed, all these objections were met it would cease to be an arbitral tribunal and would become a court of justice. The main object, as one of its authors said, was "not to render justice but to settle and put an end to the dispute." In spite of the alleged imperfections, the Court has proved of inestimable service in the settlement of certain classes of disputes. Since its creation it has determined some eighteen cases, many of first-class importance. Although the awards may have failed to give complete satisfaction, they have been loyally accepted, and disputes which might have given rise to armed conflict amicably settled. An attempt to confer compulsory jurisdiction on the Court failed. But a large number of treaties have been concluded in which the parties have agreed to refer all disputes arising between them, or specified classes of subjects, or specified subjects, to arbitration, and generally to that of the Hague Tribunal. Questions affecting "vital interests," "independence," "national honour" are usually excluded. Since 1903 such treaties have been concluded by over forty Powers. In such treaties a certain element of compulsion is involved. In 1914, prior to the outbreak of war, the United States concluded nineteen treaties providing that *all disputes of every nature whatsoever* be referred to a Permanent International Commission composed of five members appointed by the parties as therein provided. The parties agree not to declare war or commence hostilities during the Commission's inquiry and before its report is issued.

ARISTOTLE.* When we speak of the financial ideas of Aristotle we have chiefly in mind the second book of his *Economics*—one of the few financial works bequeathed to us by antiquity. During the last twenty years this book has been the subject of numerous writings. Unhappily the second and much the longer of the two chapters which compose it has nothing scientific about it. It is a collection of financial expedients strictly comparable with the Military Stratagems of Polyen. The author, whoever he is, probably a later peripatician, has simply collected some amusing and picturesque financial devices. None of them relate to the golden age of Greece (5th century), nor to her well-organised cities, nor to the great financiers of antiquity like the orator Lycurgus. All we learn from the forty anecdotes which make up the collection is that in the absence of public credit every great financial emergency condemned the Greek States (which, unlike Athens in the 5th century, had not a well-supplied public treasury) to expedients which were often disguised confiscation.

The first chapter, on the contrary, is imbued with the purest scientific character. Recognising that financial systems vary with the form of government, it distinguishes between Royal Economy, Satrapic Economy, and Political Economy (that of the free cities). The great king lived above all on tribute. The Satraps depended upon taxes (including tithe and direct taxes on men, animals, and business). The Greek cities, objecting to direct taxes as contrary to liberty, relied upon consumption taxes and other petty imposts (*ἐγκύκλια*). It is possible that this first chapter is a summary of some lecture by Aristotle, especially as we find again in the *Rhetoric to Alexander* (xxxiv.) the idea, shared later by Bodin and the German Cameralists, that the public domain is the chief and best source of public revenue.

If we wish for a more complete knowledge of Aristotle's views on finance, we must look elsewhere, and especially in his *Politics*. In Book E′ of this work we find a detailed picture of tyrannic economy. Tyranny was a regular form of government, and Aristotle shows clearly why more than any other government it needed money, why its end and aim was wealth (*τέλος τῆς τυραννίας ὁ πλοῦτος*). He shows the great expense of tyrants: body-guards, continual wars, sumptuous courts, public works, and how the tyrants like the Satraps had recourse to direct taxes and confiscations. Plato, Xenophon, and Book II. of the *Economics* complete and confirm this picture.

In Book G′ of his *Politics* Aristotle expounds his ideas on Social Finance, which found a place in the 4th century in the free cities as it does to-day in parliamentary countries. He condemns the policy of crushing the rich with taxes, "liturgies," and confiscations in order to meet expenditure for the benefit of the poorer classes. He holds that largess to the poor ruins finance without utility, and compares those who wish to succour the poor by this method to those who try to fill a pail which leaks badly. The community as a whole, and not particular classes, must be kept in view ; useless expenses, brilliant and costly fêtes, must be avoided ; commerce and industry must be encouraged ; efforts must be made to render prosperity permanent — almost Gladstonian doctrine.

Aristotle's interest in finance is also shown in the precision of the information contained in his *Athenian Republic*. Since the discovery of this work we know that it was Pisistratus

who introduced the tithe into Athens, we know the number of Athenians (20,000) who were salaried during the Peloponnesian War, that it was after this war that the salaries and doles were further generalised, that the *θεωρικόν* was not introduced by Pericles and survived the reforms of Demosthenes. Prior to 1890 all these points were controversial.

Newman's edition of the *Politics*, 4 vols., Oxford, 1887-1902.—Sir John Sandys' edition of the *Republic*, Cambridge, 1912.] A. A.

ATKINSON, Edward (1827-1905), was born at Brookline, Massachusetts. He pursued a business career and in 1877 became president of the Boston Manufacturers' Mutual Fire Insurance Company. In his writings he dealt chiefly with the controversial questions which attracted public attention. Thus he opposed the policy of Protection, which was popular with most of the manufacturers of the New England States. In 1887 he was commissioned to make a report on the position of Bimetallism in Europe, and published in the same year a volume on the subject. Towards the close of the century he attacked the Government of the United States on the ground of Imperialism, and produced in 1899 the magazine *Anti-Imperialist*. He invented an apparatus for saving labour and fuel in cooking, and published in connection with it a volume entitled *The Science of Nutrition*.

His chief writings are: *Cheap Cotton by Free Labor* (Boston, 1861); *The Collection of Revenue* (1866); *Argument for the Conditional Reform of the Legal Tender Act* (1874); *Our National Domain* (1879); *Labor and Capital, Allies not Enemies* (New York, 1880); *The Fire Engineer, the Architect and the Underwriter* (Boston, 1880); *The Railroads of the United States* (1880); *Cotton Manufacturers of the United States* (1880); *The Distribution of Products* (New York, 1885); *Bimetallism in Europe* (1887); *The Industrial Progress of the Nation* (1890); *The Margin of Profits* (1887); *Taxation and Work* (1892); *The Science of Nutrition* (1896); *Consumption Limited, Production Unlimited* (1889); *The True Policy of Protection* (1904): *Facts and Figures as the Basis of Economic Science* (1904). E. L. H.

AUSPITZ, Rudolph (1837-1906) was educated at Vienna and went subsequently to Berlin and Paris, where he studied physics and higher mathematics. On returning to Austria he entered into business and became a sugar manufacturer. From 1871 to 1900 he was a member of the Landtag of Moravia, and for the greater part of this time he was also a member of the Reichsrat. He was one of the most prominent men in the Liberal Party, and was partly responsible for the existing methods of sugar taxation and for the reform of direct taxation brought about in 1896. He opposed protectionism and indirect taxation, and favoured a system of progressive taxation. Although a sugar manufacturer, be refused to join the cartel which was formed for the purpose of regulating the price of sugar. He devoted himself also to the study of economic theory and collaborated with Richard Lieben in producing an important mathematical treatise on prices entitled *Untersuchungen über die Theorie des Preises*. In this book the modern theory of value, as expounded by the Austrian economists, was adopted. The work of Auspitz lay, however, chiefly in the practical sphere, in which he showed himself free from bias and class prejudice. E. L. H.

THE AUSTRIAN SCHOOL OF ECONOMISTS.* Carl Menger founded the Austrian School by the publication in 1871 of his *Grundsätze der Volkswirtschaftslehre* (Principles of Economics). Like the Historical School in Germany, he attacked the theory of the classical economists. He did not, however, go as far as the Germans in abjuring all theory, but tried to replace it by a new exact theory. He took the subjective theory of Value as his basis. In so doing, he hit upon the same leading idea as his contemporaries, Jevons and Walras, and his German precursor Gossen. Independently of one another, these four thinkers have laid the foundation of the new theory of value, though they differ in some particulars. Menger departed the farthest from the classical tradition. The system built up by himself and his followers is not a mere amendment of the classical system; it is really a new construction in spite of the many important ideas derived from the older system. The Classical Economists were individualists. They regarded individual interest as the motive force of economics, but none the less began to investigate national economics without troubling themselves about the economics of the private individual. They held in particular that they had only to deal with value in exchange, and they left out of account the subjective value in use to the individual. This mistake entails many others, for in national economics, value in exchange depends on the (subjective) value in use and cannot be understood apart from it; and since every economic process is measured in terms of value, as a further consequence the working of the whole economic structure cannot be understood clearly apart from it. It is Menger's great merit that he went back to the individual roots of economic facts. He himself always remained an

individualist in the sense of the classical economists. His successors ceased to be so; Wieser, especially, teaches that in national economy individuals are subject to social forces.

In another important point the Austrian School departed from the classical tradition. The classical economists had only penetrated as far into the economic structure as they thought necessary to find a basis for freedom, which was the postulate of their time. On the other hand, the Austrian School since the time of Wieser has set itself the task of finding the theoretical bases for understanding the present day, which requires protection and limitation of freedom and wants to be equally clear as to the relation of the state to national economy and that of national economy to the world economy.

Menger starts by distinguishing between free and economic goods. The former are present in excess, the assured supply exceeds the demand, while in the case of the latter, the supply is less than or equal to the demand. Only economic goods call for the exercise of forethought; they must be used with care and protected against damage; they alone are produced and exchanged; they only become property, and finally, they only can be valued. Economic value according to Menger's definition is "the importance which concrete goods, or quantities of goods, receive for us from the fact that we are conscious of being dependent on our disposal over them for the satisfaction of our wants." According to Menger, value is measured by that satisfaction which is the latest and least of the units of satisfaction required to produce the maximum total satisfaction. Wieser calls this "marginal utility" (*Grenznutzen*), Jevons "the final degree of utility." Marginal utility is based on the law of satiation of want, which states that the degree of desire for the same amount of goods diminishes with continuous satiation. In this all-important law Menger and his followers of the Austrian School agreed with Gossen, Jevons, and Walras. For details we refer the reader to the articles on the Final Degree of Utility in Vol. II.

The law of marginal utility applies not only to economic goods, but, as soon as an economic society reaches a certain stage of development, to labour also. In the primitive undeveloped stage, labour is free, the available quantity of it exceeds the demand; of course only quite unskilled labour is available. It is only in a fully developed economic society that labour, which becomes continually more skilled and specialised, enters into the economic scale of quantities. Even free labour must be dealt in and valued, because it entails, as Adam Smith says, a sacrifice of rest, freedom, and happiness. This is the basis of the theory which derives the value of the product from the trouble and risk involved in the work. Adam Smith took this as his starting-point but did not keep to it. Ricardo tried to work it out to the end, and the socialists took it over from him. The theory of labour ceases to hold good in a fully developed economic society. As soon as the quantity of labour available does not meet the demand, labour, like economic goods, is valued according to its marginal utility.

In the case of consumption goods which serve directly to satisfy wants and do not require to be produced or obtained by exchange, the marginal utility can be derived from the scale of utilities they provide. As soon, however, as production or exchange comes into play, as happens with the great majority of commodities at the present day, the marginal utility must be derived in many cases not from the utility of the thing itself, but from the remoter utilities of other goods and labour. This obscures the law of marginal utility. It is the difficult task of the theorist to make it clear. Menger did this for production goods and labour. He shows that the whole world of goods, together with the labour done upon them, falls into orders. The first or lowest order or, as Böhm-Bawerk says, proximate order, consists of consumption goods which satisfy needs immediately, *e.g.* bread. Commodities of the second order are those from which goods of the first order are made directly, *e.g.* flour. The work of the baker also, and all appliances and utensils connected with it, fall into the second order. The third order consists of those elements which produce the goods of the second order and so forth. Goods of the highest order are those which cannot, like the others, be prepared from others, *e.g.* fertile land. Labour is always in the highest order; it cannot be produced. Goods and labour of the higher and highest orders derive their value and marginal utility from that of the goods of the first order, whose production is dependent on them. When valuing the higher orders we are faced with the difficult problem of distributing the result among the different contributing factors. Menger calls all the factors co-operating in the product complementary, for each only plays its part in conjunction with others. The physical division of the joint product is impossible. We cannot determine what part of the fruit is due to the soil, what to the labour, the seeds or the implements used. Menger employs another method. He shows that the complementary factors in the production can be used in variable proportions; the earth can be worked without manure and yet not become barren. In each case it is only a part of the product that is dependent on the individual factor, and Menger determines its value in accordance with this part. Wieser and Böhm-Bawerk have proposed other formulæ. The school is not at one on this point. It is, however, at one in holding, as Wieser says, that the problem is a question

of practical imputation (*Zurechnung*). Just as judicial imputation punishes the responsible originator, so economic imputation attempts to determine the causes which are practically effective in obtaining the return. Wieser distinguishes between specific and general imputation. Specific imputation applies to the elements peculiar to a given type of production, *e.g.* the mining area. General imputation applies to the widely distributed elements, such as ordinary labour, coal or iron: the "cost elements." These elements are valued according to the smallest utility for the creation of which they may be used in any type of production; the specific elements are valued by deducting the value of the costs from the total product. Accordingly, forest land is valued low where woods abound, but a vineyard yielding a special vintage is valued highly.

Wieser has shown that the law of costs is only a special case of the marginal law. He distinguishes specific products for which specific elements are necessary and cost products for which only cost elements are used. The cost products are valued in accordance with the marginal utility of the cost elements which the latter continue to yield in any product. Specific products are valued in accordance with their own marginal utility.

Further shiftings of the marginal utility are brought about by exchange. In barter each party to the bargain parts with an article which has a less personal value in use in order to obtain a greater value in return. From this law of exchange Menger has derived the law of prices for barter in the simple types of competition and monopoly. Böhm-Bawerk, who greatly advanced the theory of value by his clear exposition and vigour in controversy, has rendered the special service of working out the theory of prices in the case of barter. Wieser formulated the law of prices for monetary transactions and applied it to modern forms of monopoly and the allied "monopoloid" formations (Dumping, Cartel, Trusts, etc.).

The price of a commodity is determined by the monetary equivalent which the marginal buyers offer for it. The marginal buyers are the buyers with the least need and the least purchasing power, who yet must buy, if all the goods on offer are to be sold. Prices are "stratified," because they are determined in the case of mass commodities by the low purchasing power of the lowest classes, in the case of luxury articles according to the purchasing power of the very rich, and for the intermediate classes according to the purchasing power of persons of moderate means. The rich buyer who buys an object of mass consumption obtains the advantage of the consumer's rent. For prices, too, the law of costs and the law of imputation hold good.

Menger recognises only subjective value, but Wieser objective value as well. Subjective value in use or subjective value in exchange is what an object is worth to the individual—its value in the economy of the private person. The objective value in exchange is what it is worth in the national economic process, its value in the national economic sense. Any one engaged in industry or trade must reckon in terms of objective exchange value.

Menger has given particular care to working out the bases of the theory of money and to establishing its origin. Wieser worked out the theory of money still further, adhering strictly to the law of marginal utility. Menger remained a metallist, but Wieser keeps a position between metallism and nominalism. He derives the exchange value of money in the first place from its value as material, but seeks to prove that the exchange value once established continues to alter of itself with historical continuity. He attacks the Quantity Theory which commits the error of transferring the law of value of the commodity to money without taking into account what is peculiar in the services money performs. The value of money stands in the closest connection with this service; in accordance with the relations of this service the value of money gives a comprehensive expression of the movements of the marginal utility of goods measured in relation to the service of money. The gradual extension of the use of money and the system of public taxation has largely contributed to the historical increase in the value of money.

Menger did not treat the theory of income, he gives only a short exposition of interest on capital. Böhm-Bawerk has dealt with capital and interest in the greatest detail; his history of the doctrine is a masterpiece of fruitful criticism. In his exposition of interest the underlying idea is chiefly that future needs are of less account in proportion to the remoteness of the time when they arrive. Wieser, who conceives also the idea of capital rather differently from Böhm-Bawerk, explains interest with a theory of productivity, on which point Böhm-Bawerk disagrees with him.

Wieser moreover develops a complete theory of income. Its most important principles are as follows.

All money income is derived through the medium of prices which follow the law of marginal utility, and therefore money income itself is subject to this law. Since productive land is a specific commodity, rent is derived by specific imputation. Ricardo's theory of agricultural rent holds good empirically, but its theoretical expression could not be completely successful, because Ricardo did not know the law of marginal utility. Urban rent is also based upon specific imputation, except that here it is not the difference of the costs of construction, but the difference of the premium which is paid for

the better sites. Interest on capital is partly productive and partly consumptive interest. The former is settled by the share of the product which is to be imputed to capital for the part it takes in production; the latter is based on the higher estimation of his present needs, which is peculiar to the debtor who is in difficulties or who is careless about money. The entrepreneur's income is the specific income of the person who directs the business, who receives the whole of the gross profit and defrays the costs. Wages rest on general imputation and are lowest among the largest classes, because their marginal product is the lowest.

Wieser also examines the relations of State and world economics. The State in its private business must take exchange value into account; in its public administration, however, it must in the first place consider the different needs, even if these needs are not supported by adequate purchasing power. While market prices are stratified in accordance with purchasing power, and goods are distributed accordingly, state services should be distributed according to need, and taxes should be assessed with a progressive burden on the higher incomes. Free interchange of men, capital, goods, and ideas between the different nations is prevented by barriers due to historical circumstances. Prices and income therefore are not so completely brought to a level as within the nation, the development of production is not uniform, trade centres are not always placed or stocked in accordance with the natural advantages of the situation. Every developed system of national economy is a unity, but world economy has not as yet become one. If it were, free trade would be advisable, as it is within the nation. As long as it is not a unity, protective tariffs are justified.

Menger's exact method was violently attacked by the German historical school, whom Menger himself opposed with no less violence. To-day the difference has been bridged. According to Wieser, the theory, in order to isolate and idealise, starts with assumptions of the widest possible application in order to lead through a system of steadily decreasing abstractness down to the concrete reality, where the work of the historical and realistic method begins. The theory builds up from the common experience found in the consciousness of every individual who has grown up in an economic environment; the historical realistic method, on the other hand, must use sources only accessible to scientific research.

A succession of younger men in Austria have accepted the teaching of the founders of the school. Many of these younger investigators oppose the subjective starting-point of the doctrine. They fear the objection that the psychological basis endangers the certainty of the result. The founders of the school, however, never employ principles taken from scientific psychology. The law of satiation of wants, which is chiefly in question, they have taken from general economic experience, and the development of their doctrine is purely empirical.

The Austrian school has had an influence extending outside Austria, but Germany was the last to be affected by it and hitherto the least. The bibliography appended gives the most important foreign authors who have adhered to the main tenets of the school, but it leaves out those who have only drawn upon it for an idea or so.

The most important works of the founders of the Austrian school are the following:

Carl Menger, *Grundsätze der Volkswirtschaftslehre*, Vienna, 1871; Posthumous 2nd edition, Vienna, 1923; *Methode der Sozialwissenschaften*, Leipzig, 1883.—Friedrich von Wieser, *Ursprung und Hauptgesetze des wirtschaftlichen Wertes*, Vienna, 1884; *Der natürliche Wert*, Vienna, 1889; *Natural Value*, edited with preface and analysis by William Smart. Translated by C. A. Malloch, 1893; and *Theorie der gesellschaftlichen Wirtschaft* in section i. of the *Grundriss der Sozialökonomik*, Tübingen, 1914. Here Wieser, starting from the principles laid down by the Austrian school, tries to construct a comprehensive theoretical system of social economics.—Eugen von Böhm-Bawerk, *Kapital und Kapitalzins*, vol. i.; *Geschichte und Kritik der Kapitalzinstheorie*, Innsbruck, 1884; 4th edition, Jena, 1921; *Capital and Interest*; a critical study of economical theory. Translated with preface and analysis by W. Smart, 1890; Vol. ii., *Positive Theorie des Kapitals*, Innsbruck, 1889; 4th edition, Jena, 1921; *Positive Theory of Capital*. Translated with preface and analysis by William Smart, 1891. This remarkable work, translated into many languages, has largely helped in gaining an international reputation for the Austrian School. The second volume contains, besides the positive theory of capital and interest, an illuminating development of the theory of value and prices.

[Cf. the articles on Carl Menger and Böhm-Bawerk. Also Wesley C. Mitchell, "Wieser's Theory of Social Economics" in the *Political Science Quarterly*, vol. xxxii. No. 1. See also James Bonar, "The Austrian Economists," in the *Quarterly Journal of Economics*, iii., Boston, 1888.]

Among the authors who carried on the teaching of the Austrian School the following are to be specially noted.—Emil Sax, *Grundlegung der theoretischen Staatswirtschaft*, Vienna, 1887; *Die Verkehrsmittel in Volks- und Staatswirtschaft*, 3 vols. 1918-22.—Robert Meyer, *Principien der gerechten Besteuerung*, Vienna, 1884; *Wesen des Einkommens*, Berlin, 1887. Both authors have the merit of having applied the theory of marginal utility to the theory of taxation.—Eugen von Philippovich adopted the theory of marginal utility (without, however, developing it further) in his much-read textbook, *Grundriss der politischen Ökonomie*, i., 15th ed., Tübingen, 1920.—Josef

Schumpeter, *Wesen und Hauptinhalt der theoretischen Nationalökonomie*, Vienna, 1908, brings the Austrian doctrine into connection with that of Léon Walras. His second large work: *Theorie der wirtschaftlichen Entwicklung*, Leipzig, 1912, no longer follows the same line. His *Epochen der Dogmen- und Methodengeschichte* (Part 1 of the *Grundriss der Sozialökonomik*, Tübingen, 1914) is a short but profound study of the development of the theoretical schools of political economy before the Austrian School.—H. Oswalt, *Vorträge über wirtschaftliche Grundbegriffe*, 4th ed. 1922, gives a particularly clear account of the doctrines of the Austrian School.—Emil Lederer, *Grundzüge der ökonomischen Theorie*, Tübingen, 1922, tries to bring the Austrian teaching into line with Marxist theory. Besides these writers the following should be mentioned.—Viktor Mataja, *Der Unternehmergewinn*, Vienna, 1884.—Richard Schüller, *Die klassische Nationalökonomie und ihre Gegner*, Vienna, 1885; *Schutzzoll und Freihandel*, Vienna, 1905.—Robert Zuckerkandl, *Theorie des Preises*, Leipzig, 1889. The article *Preis* in *Handwörterbuch der Staatswissenschaften*, 4th ed., Jena, 1924.—Georg Sulzer, *Die wirtschaftlichen Grundgesetze*, Zürich, 1895.—Leo Petritsch, *Die Theorie von der sogenannten günstigen und ungünstigen Handelsbilanz*, Gratz, 1902; *Zur Lehre von der Überwälzung der Steuern*, Gratz, 1903.—K. Soda, *Geld und Wert*, 1909.—Ludwig Mises, *Theorie des Geldes und der Umlaufsmittel*, Munich, 1912.—Ernst Broda, *Die Lösungen des Zurechnungsproblemes* in *Zeitschrift für Volkswirtschaft*, Vienna, vol. xx.—Hans Mayer, *Untersuchung zu dem Grundgesetz der wirtschaftlichen Wertrechnung*, ditto, new series, vols i. and ii.—Franz X. Weiss, *Produktionsumwege und Kapitalzins*, ditto, new series, vol. i.—Leo Schönfeld, *Nutzen und Wirtschaftsrechnung*, ditto, vol. iii.—L. Stephinger, *Wert und Geld*, 1918.—Oscar Engländer, *Bestimmungsgründe des Preises*, 1921.—Carl Landauer, *Grundprobleme der funktionellen Verteilung des wirtschaftlichen Wertes*, 1923. Of non-German authors closely connected with the Austrian School the following should be mentioned.—N. G. Pierson, *Leerboek der Staatshuishoudkunde*, Haarlem, 1890. *Principles of Economics*. Translated from the Dutch by A. A. Wotzel, 2 vols. 1902, 1912.—Maffeo Pantaleoni, *Principii di economia pura*, 2nd ed. 1894; *Pure Economics*. Translated by G. Boston Bruce, 1898.—Simon N. Patten, *Theory of Dynamic Economics*, Philadelphia, 1892.—Herbert J. Davenport, *Value and Distribution*, Chicago, 1908.—V. M. Urban, *Valuation: its Nature, its Laws*, 1909.—Albert Aftalion, *Les trois notions de la productivité* in *Revue d'Économie politique*, 1911.—Frank A. Fetter, *The Principles of Economics*, New York, 1911.—G. Bagge, *Arbetslönensreglering genom sammanslutninger*, Stockholm, 1917.—Wolfgang Heller, *Kozgazdasagtan*, Budapest, 1919.—Erik Lindahl, *Die Gerechtigkeit der Besteuerung*, Lund, Berlin, 1919.—Knut Wicksell, *Vorlesungen über theor. Nationalökonomie*, vol. i. 1913, vol. ii. 1922.—L. V. Birck, *The Theory of Marginal Value*, London, 1922.—C. A. Verrijn Stuart, *De Grondslagen der Volkshuishouding*, 1920. F. W.

AVERAGE, UNWEIGHTED. See AVERAGE, WEIGHTED.

AVERAGE, WEIGHTED (in Statistics). When we seek to take an average of a number of figures, it is frequently the case that the importance attached to the different figures ought not to be the same throughout, but that some of them ought to be *weighted* relatively to others. Suppose, for example, that in a given market the price of corn on one day is thirty-two shillings, and on the following day thirty-six shillings a quarter, but that the amount of corn bought and sold on the first day is three times as much as on the second. Then, if we consider simply the prices, the average for the two days will be thirty-four shillings; while, if we also take into account the amount sold, the average will be thirty-three shillings. The former is the *unweighted average*, the latter the *weighted average*; and the latter will for most purposes have the greater utility. An important case in which a weighted average is desirable is in the construction of an index-number for measuring changes in the purchasing power of money. It is clear that, if we wish to measure the value of money for the average consumer, a commodity which is in general consumption in large quantities should have greater weight attached to it than one which is consumed by certain classes of the community only, and by them perhaps in small quantities.

[See INDEX NUMBERS, and cf. Bowley, *Elements of Statistics*, pp. 111-118.]

AVERAGES.* The doctrine of average, being fundamental in Statistics and Probabilities, is discussed in all general treatises on these sciences, of which many have appeared since the preceding article was written. Above the crowd of text-books may be distinguished Bowley's *Elements of Statistics* (4th ed. 1920), and Yule's *Introduction to the Theory of Statistics* (5th ed. 1919). Many new aspects of the subject are presented in the stupendous series of contributions to the Mathematical Theory of Evolution by Professor Karl Pearson, published in the *Transactions* of the Royal Society. *Biometrika*, edited and in great part written by him, is also a rich mine of original theory. Averages, with a kindred topic the Law of Error, occupy the Second Part of the article on "Probability" in the *Encyclopædia Britannica* (ed. 11). The various species of averages are simply and clearly described by Zizek, *Die statistischen Mittelwerte* (1908); translated under the title *Statistical Averages* by W. M. Persons (1913).

The use of the *Median* advocated in the article on the *Choice of Means*, referred to in the article on AVERAGES, has been further defended by the same writer in the *Philosophical Magazine* (December 1923), and, with special

reference to index-numbers, in the *Economic Journal* (June 1918), and the *Journal of the Royal Statistical Society* (July 1923).

F. Y. E.

AVES, Ernest (1857-1917). Ernest Aves, born at Cambridge, was educated at Trinity College there and took a first class in the Moral Sciences Tripos in 1883.

In 1886 he went to reside at Toynbee Hall in East London, and commenced the study of social and economic conditions to which he was subsequently to devote his life. For twelve years from 1889 he was secretary to the Council of the University Settlements Association, and for seven sub-warden of Toynbee Hall under Canon Barnett.

His work at Toynbee Hall first brought him into touch with Mr. Charles Booth, who invited him to be one of his principal collaborators in the production of his *Life and Labour of the People in London.* Aves was not only responsible for the articles in the earlier volumes of that work on the Building and Furniture Trades, into the conditions of which he had made extensive and laborious enquiry, but in the ninth volume he produced together with Booth the profound survey and analysis of the whole industrial field in London which is comprised in Part III. of that book. His study of Trades Unions, hours of labour, and irregularity of earnings formed a contribution of much value both to the contemporary investigation of such questions and to the judgment that History will ultimately pass on the Industrial Age.

In 1907 appeared his own *Co-operative Industry*, a careful study of what co-operation has accomplished, especially for the town-dweller in recent years, not merely in the domain of diminishing costs and increasing accessibility, but also in regard to what may be called elementary economic education.

He also contributed various articles to the *Encyclopædia Britannica* on wages, hours of labour, and kindred questions, and a large number of papers on economics and sociology to economic reviews.

Aves was a prominent pioneer of that large army of voluntary or quasi-voluntary workers in the social field which in the last generation or two has by its industry and the significance of its task almost established itself as a miniature civil service in this country. J. H. M.

[BANKING*], BANKS.*—The Commonwealth Bank of Australia was established in December 1911 by a special Act of Parliament of the Commonwealth of Australia. It was the first, and, so far, the only entirely State-owned bank of the British Empire. The Commonwealth Government is responsible for all the moneys due by the bank, and thus there is ample guarantee for the safety of funds entrusted to its care. Another singular fact is that it has no capital and has up to the present needed none, though provision exists for the bank to issue capital stock up to £10,000,000. One half of the net profits is credited to the bank's reserve fund, and the other half to a redemption fund. The latter may be utilised to pay off Government debts or State debts taken over by the Commonwealth. In time, therefore, the accumulated profits of the bank might conceivably be large enough to wipe out Australia's public debt. On its establishment the accounts of the Commonwealth Government were transferred to the bank. The growth of the bank has been extraordinarily rapid. It started in 1912 with a loan of £10,000 from the Commonwealth Treasury, but by 1922 it possessed assets of over £140,000,000, while depositors numbering over 843,000 had balances at their credit exceeding £36,000,000. The bank transacts both general and savings bank business, and in 1922, in addition to its sixty branches, had 3200 savings bank agencies, mostly at post offices. By the Commonwealth Bank Act, 1920, which repealed the Australian Notes Act, the management of the Australian note issue passed to the Commonwealth Bank, with the result that the whole business of distributing and withdrawing Australian notes is now in its hands. At this time the total of notes outstanding was £55,012,564, including the holdings of all the banks. The gold reserve was £23,309,622, representing 42·37 per cent of all notes outstanding.

The Imperial Bank of India was constituted under the Imperial Bank of India Act 1920 for the purpose of taking over the undertakings and business, as from 27th January 1921, of the three Presidency Banks, the Bank of Bengal, the Bank of Bombay, and the Bank of Madras. For many years these banks had been regarded as semi-official institutions, and as "bankers' banks," and it had been felt that their interests were common and demanded a co-ordinated policy. During the period of the War, friendly, though informal, co-operation emphasised this feeling of mutual interest. Moreover, the events of the period had brought the Government into closer touch with these banks, and it was important that these relations should continue. The provision of up-to-date banking facilities was essential for the proper development of industrial India, the more so because of the people's predilection for holding their savings in a metallic form. The earlier discussions on the subject were in the direction of the creation of a State Bank, but for various reasons the proposals fell through, and instead

the amalgamation scheme was adopted. The shares in the Presidency Banks were exchanged, with some adjustments, into shares of the new bank, and the capital increased to Rs. 1125 lakhs, of which one-half was to be paid up at the outset. The governing body, or Central Board, of the bank was designed to secure adequate representation of all important interests concerned, including Government, Local Boards, the shareholders, and the general public. In accordance with the by-laws, the discharge of the functions of the Central Board was delegated to a small managing committee, meeting regularly and exercising the full administrative powers of the Central Board, subject to any special instructions which it might receive from that body. The appointment of the bank as the sole banker for the Government of India will, it is confidently expected, result in considerable economy, as it will release for the benefit of trade the funds which previously have been locked up in the separate reserve treasuries, and at the same time the public will be provided with facilities for the transfer of money at a moderate charge. The bank has undertaken to establish and maintain, within five years from the commencement of the Act, not less than one hundred new branches, of which at least one-fourth will be established at such places as the Government may direct. A London Office has been opened to conduct business on behalf of the bank's own constituents and to re-discount bills of exchange for the Exchange and other banks, but the bank will not compete with the Exchange Banks in the ordinary exchange business. From what has been said it will be seen that the position of the Imperial Bank differs in material respects from that of central banks in countries where there already exists a highly developed banking system and a central discount market. The policy with regard to the administration of the note issue and the London remittance business of the Government has been left for future decision.

[For further details, see *Economic Journal*, vol. xxxi. p. 147.]

The South African Reserve Bank was established at Pretoria by Act of the South African Parliament in 1920, following the Report of a Select Committee on the Embargo on Export of Specie. The Act provided for a capital of £1,000,000, of which one half was to be subscribed by the South African Banks in proportion to their capital and reserve funds. The other half was offered to the public, and any part of it not subscribed by the public was to be taken up by the Treasury. The bank's dividend was limited to 10 per cent, but while there is an embargo on the export of gold from South Africa, or so long as gold certificates are inconvertible, it may not pay a dividend of more than 6 per cent per annum, and all excess profits during such period must be placed to a special fund for strengthening the gold reserve of the bank. When the reserve fund is equal to the paid-up capital, the net profits, after payment of a dividend of 10 per cent, are to go to the Government. The sole right to issue notes in South Africa was given to the bank for twenty-five years, and the commercial banks ceased to issue their notes on 1st July 1922. The note circulation on 31st March 1923 amounted to £9,866,414. The Reserve Bank notes are to be secured by at least 40 per cent in gold cover, and as to the remainder by commercial paper or trade bills, and by a first charge on all the assets of the bank. These reserve requirements may be temporarily suspended with the consent of the Treasury and subject to the payment of a graduated tax on the note issue, rising as the gold reserve falls below 40 per cent, and subject also to a corresponding increase in the interest and discount rates of the bank. The Act further required all banks transacting business in South Africa to maintain reserve balances with the bank equal to 13 per cent of their demand liabilities and 3 per cent of their time liabilities. The bank is administered by eleven directors, of whom three experienced in banking and finance are nominated by the stock-holding banks and appointed by the Governor-General, and three, who must at the time of their election be actively engaged in commerce, agriculture, or some other industrial pursuit, are elected by stock-holders other than banks, and five (including a Governor and Deputy Governor) appointed by the Governor-General. Branches may be established by the bank within the Union, and, with the consent of the Government, outside the Union, and the bank may, subject to certain restrictions, carry on the usual business of bankers. The most important of these restrictions are that it may not advance money on mortgage nor own fixed property, except for its own business premises, that it may not make unsecured advances, draw or accept bills otherwise than on demand, accept deposits for a fixed term or allow interest on credit balances on current accounts.

[See also *Economic Journal*, vol. xxxi. p. 172.]

F. W. G.

BANK NOTE (United States of America).* The note circulation of the national banks was until the organisation of the Federal Reserve System in August 1914 the only authorised bank note. This circulation was regulated, in the main, by the provisions of the Acts of 1863, which required that all issues be secured by United States bonds deposited in the Treasury. Conditions relating to such deposits and their relation to the amount of notes issued were from time to time changed, but at present bonds may be deposited in a sum equal, for each bank, to the amount of its capital stock,

the notes issued to it then being equal to the par value of the bonds so deposited. Originally limited in aggregate amount, such limitation was later removed, so that the note circulation of the national banks had reached about $730,000,000 in 1914, and was chiefly restricted at that date by the scarcity of so-called circulation bonds. The obvious defects of this type of note issue led to the insertion of a provision in the Federal Reserve Act which released national banks from the necessity of depositing bonds with the Treasury in any amount as a condition of the retention of their charters, although it permitted the banks to continue, if they chose, to deposit such bonds; and to receive back circulation up to the amounts permitted by law, should they so desire. Banks already holding the bonds were to be protected by a provision which permitted the Federal Reserve Board to order the purchase of such bonds from "member banks" at the rate of $25,000,000 per annum. With the entrance of the United States into the World War, such purchases were suspended, and the amount of notes outstanding remained about stable, being in the middle of 1924 approximately $730,000,000. The Federal Reserve Act sought to provide for an elastic currency. It directed that the chairman of each Federal reserve bank should receive from the governing authorities of the bank, at their discretion, discounted paper held by them, and in exchange should issue Federal reserve notes in amount equal to the face of the paper. The bank itself was required to hold a gold reserve of 40 per cent against these notes (but of this 40 per cent, 5 per cent was to be on deposit with the Treasurer of the United States for the purpose of making conversion of gold into demand). In later amendments, provision was made for direct deposits of gold with the Federal reserve agents, while the holding of a gold reserve in the vaults of the bank was dispensed with, provided that the Federal reserve agent himself was in possession of gold equal to 40 per cent of the notes outstanding. An issue of $100,000 of Federal reserve notes might thus be represented by $60 eligible paper in the hands of the Federal reserve agent, $35 gold, also in his hands, and $5 in the hands of the Treasurer. In these circumstances, the Federal reserve note to-day evidently represents a fluctuating base partly composed of eligible paper and partly of gold. The note issue has shown considerable elasticity even under these conditions; and at present the amount outstanding (end of June 1924) is about $2,400,000,000. Federal reserve notes are a first lien on the assets of the bank issuing them, and are also the obligations of the United States Government, but they are not legal tender although payable to the Government in liquidation of taxes, customs, and other public dues. At the same time, the Federal Reserve Act made provision for a new type of currency entitled "Federal reserve bank notes." These were to be in all respects similar to the old national bank notes, resting on the bonds purchased by the reserve banks as previously explained, while safeguarded in exactly the same way as regards redemption, by a 5 per cent fund with the Treasurer of the United States. These notes were called into existence to an unexpected extent during the war, for the purpose of replacing the silver certificates. The issue of the certificates had been suspended, and those outstanding withdrawn, so that new notes were, in the opinion of Congress, required in order to furnish a currency to fill the "vacuum" caused by the withdrawal of the certificates. As silver was repurchased under the Pittman Act subsequent to the close of the war and new certificates reissued, the Federal reserve bank notes have been retired, so that to-day (middle of 1924) the outstanding amount of Federal reserve bank notes in actual circulation is not more than $325,000. Until 1914, the note circulation of the National Banks, which provided about $730,000,000 of paper currency, was arranged upon the well-known bond deposit principle (see BANK NOTE, UNITED STATES OF AMERICA). This bond-secured issue had long been regarded as undesirable, and the Federal Reserve Act of 23rd December 1913 provided for its retirement. This plan proved unsuitable to the times, owing to the opening of the War and the entry of the United States into the conflict, so that the national bank note system has remained practically unchanged in amount. The "Federal reserve notes" provided for in the Federal Reserve Act were intended to be true bank notes, regulated in their amount by the volume of rediscounts with the Federal reserve banks. Later, and partly as a result of war conditions, they came to be based either upon gold or discounted paper, while the latter was allowed to include the direct notes of member banks protected by national bonds as collateral. During the latter part of the War, when the quantity of such collateral was very great, the distinction between these Federal reserve notes so protected and the national bank notes was one of theory only. In addition to the Federal reserve notes, the Act also authorised Federal reserve banks to issue "Federal reserve bank notes" protected by national bonds exclusively, and hence exactly identical with national bank notes. The redemption of all notes of these three kinds is now carried on at the place of business of the issuing bank: the national bank notes and the Federal reserve bank notes in "lawful money of the United States," toward which a 5 per cent

in lawful money on the extent of the note circulation is required to be constantly kept on deposit with the Treasurer of the United States, who also directly redeems the note on demand. The Federal reserve notes are redeemable at their place of issue, in gold, at the Treasury (like the other notes), and at other Federal reserve banks (in gold or lawful money). The safeguards behind the national bank notes and Federal reserve bank notes are (1) Government bonds equal to face; (2) limitation of the notes of the national banks to capital; (3) a 5 per cent redemption fund in the Treasury. Federal reserve notes are protected by (1) 100 per cent paper or paper of eligible character or gold (the latter not less than 40 per cent) in the hands of a Federal reserve bank or its chairman; (2) 5 per cent gold (counted as part of the 40 per cent mentioned above) with the Treasurer of the United States, and various provisions for enforcing the prompt return of the notes to their issuer. National bank notes are practically a stationary element in the circulation and Federal reserve bank notes a declining element. Federal reserve notes have largely displaced gold certificates, and their increase or decrease is largely due to changes in current demand for circulating medium or to fluctuations in the volume of business.

H. P. W.

BARTON, John,* is praised by Ricardo, who quotes from his essay on "The Condition of the Labouring Classes of Society" and adds: "Mr. Barton, in the above publication, has, I think, taken a correct view of some of the effects of an increasing amount of fixed capital on the condition of the labouring classes. His Essay contains much valuable information." *Principles*, 3rd edition, 1821, p. 480. He is also quoted by Malthus, *Political Economy*, p. 261; Marx, *Das Kapital*, i.[1] 655, and *Theorien über den Mehrwert*, 1905, ii., 2nd part, p. 370; Villermé, *Tableau de l'état physique et moral des ouvriers*, 1840, II. pp. 20-21.

S. B.

BAUDRILLART, Henri Joseph Léon (1821-1892), was in 1852 appointed deputy professor to Michel Chevalier in the Collège de France; in 1866 he was called to the chair of history of economic doctrines in the same *collège*. He was also Professor of Political Economy in the École des Ponts et Chaussées and a member of the Académie des Sciences Morales et Politiques.

An untiring and well-informed investigator of historical, philosophical, and economic matters, it may be said that as an economist his ruling preoccupation has been to demonstrate that no contradiction exists between the doctrines of the liberal school, to which he belonged, and the rules of conduct as laid down by moral science. These views he already defended in one of his first and principal works, *Les Rapports de la morale et de l'économie politique* (Paris, 1860), and thirty years later, in the article "Morale" which he contributed to Léon Say's *Nouveau Dictionnaire d'économie politique* (1892).

The first book, by which he attracted the notice of learned circles, is his volume on *Jean Bodin et son temps; tableau des théories politiques et des idées économiques au seizième siècle* (Paris, 1853), describing after an introduction on the leading economic and political ideas of the period, the life and writings of Bodin, and giving a full analysis with commentaries of his *République*. It remains the standard book on the subject.

Baudrillart's *Histoire du luxe public et privé depuis l'antiquité jusqu'à nos jours* (Paris, 4 vols., 1878 and 1880) is another outcome of his favourite studies on the reciprocal influences having existed and existing between ethics and social economics; it is a sort of encyclopedic and historical account of the character of public and private luxury from the dawn of history to our own times.

The three volumes of his *Populations agricoles de la France* (Paris, 1880 to 1893) were written as the report of an extensive inquiry entrusted to his care by the Académie des Sciences Morales et Politiques. The first volume comprises Normandy and Brittany; the second Maine, Anjou, Touraine, Poitou, the country around Paris, Picardy, and Artois; the third volume on Central France was published by his son after his death, and is in fact as much the work of the son as of the father. The object of his inquiry was, not cultivation itself, but the moral and material situation of the agricultural populations; to reach his aim, he combined direct observations of the present with the study of the past.

Baudrillart was also a frequent contributor to the *Journal des économistes*, to the *Revue des deux mondes*, and to Franck's *Dictionnaire des sciences philosophiques*. Besides the four large works mentioned above, he published: *Manuel d'économie politique* (1857); *Études de philosophie morale et d'économie politique* (1857); *Publicistes modernes* (1862); *La Liberté du travail, l'association et la démocratie* (1865); *Éléments d'économie, rurale, industrielle et commerciale* (1867); *Économie politique populaire* (1869); *La Famille et l'éducation en France* (1874).

E. Ca.

BILLS OF EXCHANGE ACT 1882, Amendment and Interpretation of. In the case of Capital and Counties Bank *v.* Gordon [1903], A.C. 240, the House of Lords decided that where a banker credited a customer with a crossed cheque as cash before receiving payment thereof, he did not subsequently receive payment only for the customer, but for himself, so that in the event of a forged endorsement, he lost the protection of sec. 82 of the Bills of Exchange Act 1882, and was liable for conversion, or money had and received, to the true owner. To obviate the risks and inconvenience occasioned to bankers by this

decision, the Bills of Exchange (Crossed Cheques) Act 1906 was passed, after several previous futile introductions. It enacts that "a banker receives payment of a crossed cheque for a customer within the meaning of sec. 82 of the Bills of Exchange Act 1882, notwithstanding that he credits the customer's account with the amount of the cheque before receiving payment thereof." Presumably crediting in the pass-book is included, not only the uncommunicated entry in the bank-books. The effect of the Act appears to be confined to cheques, *i.e.* bills of exchange drawn on a banker payable on demand, excluding orders for payment conditional on signature of an annexed receipt and drafts drawn by a branch on head office of the same bank, or *vice versa*, both of which were held in the Gordon case not to be cheques. The new Act further affects only the position between the collecting banker and the true owner, leaving untouched the other rights and liabilities arising from such crediting as cash. These, as deducible from the Gordon case, include the right of the customer to draw against uncleared cheques credited as cash, in the absence of any agreement to the contrary express or implied, and the right of the banker to debit his customer with such cheques, if returned unpaid, or to sue the parties thereto, irrespective of the state of the customer's account.

Two other points were finally decided by the above case: First, that a collecting banker can acquire no protection by crossing to himself, under sec. 77 (6), a cheque received by him uncrossed. Second, that a banker's draft, of the nature before mentioned, though not a bill or cheque, is a draft or order drawn on a banker within the meaning of sec. 19 of the Stamp Act 1853, so that the banker is not liable for paying such documents on a forged endorsement. Again, apart from legislation, sec. 7, subsec. 3 of the Bills of Exchange Act received a somewhat narrow interpretation in the two cases of Vinden *v.* Hughes [1905], 1 K.B. 795, and Macbeth *v.* North and South Wales Bank [1906], 2 K.B. 718, affirmed by C.A. Oct. 16 [1907], 123 L.T. p. 529, in which it was held that the payee of a cheque who is existing and intended to receive the money is not fictitious or non-existing within the meaning of the subsection, though the drawer was not indebted to him, and his name was suggested or even inserted by a third person merely to give colour to the transaction for his own ends. In Colonial Bank of Australasia *v.* Marshall [1906], A.C. 557, the Judicial Committee of the Privy Council decided that the leaving blank spaces when drawing a cheque is not a sufficient breach of the customer's duty to his banker to justify the latter in debiting the customer with more than the original amount of the cheque, should that amount be fraudulently raised and the larger sum paid by the banker innocently and without negligence. The old, but somewhat discredited case of Young *v.* Grote, it was held, can no longer be regarded as of any authority. (See BILL OF EXCHANGE.) J. R. P.

Under the Bills of Exchange (Time of Noting) Act 1917 (7 & 8 Geo. V. c. 48), when a dishonoured bill is noted, it need no longer be noted on the day of its dishonour. It may be noted on that day, "and must be noted not later than the next succeeding business day." This Act was passed to give relief when there was a shortage of notaries' clerks during the late War. M. D. C.

BIRTH-RATE.* The decline of the birth-rate in this country and many others during recent years is remarkable. Among numerous books and articles investigating the causes of this phenomenon, Yule's pamphlet on *The Fall of the Birth-rate* (1920) deserves particular mention. The select references which he gives will enable the reader to pursue the investigation of causes. The facts are to be gathered from the Reports of the Registrars of births, deaths, and marriages in Great Britain and Ireland, and the corresponding official returns in other countries; together with the Summaries published from time to time in the *Journal of the Royal Statistical Society*, and other learned periodicals. F. Y. E.

BLOCK, MAURICE (1816-1901). Born in Germany, but educated in France, he became a Frenchman by naturalisation as soon as he was of age, and was attached from 1843 to 1861 to the statistical department of the ministry of Agriculture, Industry, and Trade; in 1880 he was elected a member of the *Académie des sciences morales et politiques*.

An untiring worker in the field of statistics, Block edited during forty-four years (1856-1900) the *Annuaire de l'économie politique et de la statistique*; he also published the *Statistique comparée de la France* (2 vols., 2nd edit. 1875); the *Traité théorique et pratique de la statistique* (1886), and several works of reference, such as the *Dictionnaire de l'administration française* (4th edit. 1898), the *Dictionnaire général de la politique* (1874), and the *Petit dictionnaire politique et social* (1896).

Conversant with most European languages, Block from 1866 to the end of his life wrote for the *Journal des économistes*, a quarterly review of periodical economic publications issued out of France (*Revue des principales publications périodiques de l'étranger*). He condensed the fruits of his extensive reading and of his lifelong interpretation of foreign thought in the two volumes of his *Progrès de la science économique depuis Adam Smith* (two editions, 1890 and 1897). The plan adopted is the treatment of each subject (nature, labour, capital, credit, etc.) in a distinct chapter; at the beginning the present state reached by science is exposed, and at the end the views of the

leading French and foreign economists are summed up, mostly in their own words.

A clear and exact thinker, with a tendency to sarcastic humour, Block remained faithful to the doctrines prevalent at the time of his youth, and considers reason a safer scientific guide than feeling and ethics. E. Ca.

BOARD OF TRADE.* In 1904 Lord Jersey's Committee suggested that the President of the Board should receive the position of a Secretary of State and be given the title of Minister of Commerce and Industry. This recommendation was not carried out, but it was decided that the salary of the President should no longer be limited as it had been under the Board of Trade Act of 1826. The Board of Trade Act of 1909 decreed that the President should be paid such annual salary as Parliament might determine. The increased salary (£5000 per annum) was first paid for the year 1910.

The history of the last forty years has shown a continuous expansion in the duties which the Board of Trade has been called upon to perform. This in turn has led to a multiplication of Departments within the Board, and finally to the development of certain new ministries (those of Labour and Transport). In 1883 the passing of the Bankruptcy Act brought about the establishment of the Bankruptcy Department. In 1909 the Companies Department was created for the purpose of registration and regulation of Joint Stock Companies. The administration of the Trade Boards Act, the Labour Exchanges and Unemployment Insurance involved the Board in additional duties. As a result, a division took place in the Commercial, Labour and Statistical Department, the Labour Department remaining in charge of the Controller-General and the Commercial Department being put in charge of an Assistant Secretary. In 1911 an Industrial Council was set up and a Chief Industrial Commissioner's Department was created, which took over the powers of conciliation and arbitration previously exercised by the Labour Department. In 1913 the administration of the Labour Exchanges and Unemployment Insurance was transferred to a separate Department with an Assistant Secretary; the collection of Industrial Statistics was also transferred to a Department of Labour Statistics under the control of a Director. The Labour Department then ceased to exist.

During the War some of the functions of the Board of Trade devolved upon certain new ministries—those of Shipping, Food, Labour, and Transport. Of these, however, only the ministries of Labour (1917) and Transport (1919) have been made permanent. Several new Departments were also created during the War and the years that immediately succeeded it, the chief being the Joint Department of Overseas Trade (established jointly with the Foreign Office) and the Mines Department formed under the Mining Industry Act of 1920. An important memorandum on the Reorganisation of the Board of Trade (Cd. 8912) was issued in January 1918. This memorandum suggested that the Board of Trade should be organised in two main divisions—(1) Department of Commerce and Industry, dealing with vigilance and information. (2) Department of Public Services, possessing administrative functions. Stress was laid on the formation of an Intelligence Department, to be known as the "General Economic Department," within the first division.

The following Departments now exist within the Board of Trade—(1) Secretariat, (2) Intelligence and Parliamentary, (3) Commercial Relations and Treaties, (4) Industries and Manufactures, (5) Industrial Property, (6) Standards, (7) Statistics, (8) Mercantile Marine, (9) Companies, (10) Bankruptcy, (11) Legal, (12) Finance, (13) Establishment, (14) Board of Trade Journal, (15) Mines, (16) Overseas Trade. The two latter are administered by Parliamentary Secretaries.

[See Commercial Intelligence, below; *Report of Committee on Machinery of Government*, 1918; *Memorandum with respect to the Reorganisation of the Board of Trade*, 1918; *Committee on Staffing and Methods of Work in the Board of Trade*, 1921.] E. L. H.

BOCCARDO, Girolamo (1829-1904), born in Genoa, died in Rome. He began his career as a journalist in 1848, but refused to enter into political life when Cavour offered him the undersecretaryship of the ministry of Agriculture, Industry, and Commerce. He was president of the Technical Institute of Genoa and professor at the university. In 1877 he was appointed senator, and in 1888 councillor of state. As an economist he was a very learned but not original thinker. He worked for the diffusion of economic science by writing in 1853 a very concise and clear manual of political economy, substantially on the lines of John Stuart Mill and his French contemporaries, a manual which had a great success, especially among students preparing for examinations in public offices where political economy was requisite and amongst students of technical institutes. In 1859 he published a *Universal Dictionary of Political Economy and Commerce*, which was republished 1875. But Boccardo influenced the studies of political economy more particularly when he succeeded Ferrara in the editorship of the *Biblioteca dell' Economista*. Ferrara used to say he knew of no German economist worth reading except Roscher, and would not publish translations of German economists; Boccardo went in the opposite direction and opened the *Biblioteca* to all dissenters from the so-called classical school (see Classical Economists). He published, besides Roscher, Schäffle,

WAGNER, Schönberg, MARX, LASSALLE, and amongst the English MACLEOD and OWEN. Boccardo, very naturally, considering his receptive mind, was under the sway of SPENCER's evolutionism, and strongly inclined to sociological studies. His prefaces to the economists whose works he published are easy and interesting reading, like articles in the *Revue des Deux Mondes*; but they are very far from being comparable to those of Ferrara, his predecessor. The principal subjects they discuss are: the economic and social problem in Germany; the heretics of political economy and social legislation; the principles of science and art in finance; quantitative methods applied to economics, statistics, and social science; the philosophical principles of political economy; method and limits of political economy; man and animal; sociology in history, science, religion, and the Cosmos; credit and banks. In these essays he tried to render classical and political economy more complete and correct by utilising mathematics, biology, and history. Boccardo published also JEVONS and WALRAS. Besides these purely scientific publications, he took a very active share in questions of the day, concerning the Italian banks of issue, forced currency, mercantile marine, labour problems. He was a free trader and opposed socialism on many occasions. When wearied with economic studies he used to turn to physical geography, and wrote on earthquakes and volcanoes, and also on the physical structure and formation of our globe. He was a man full of character, and esteemed for his strong sense of duty. M.P.

BÖHM-BAWERK, EUGEN VON (1851-1914), was one of the founders of the Austrian School of Economists. He and Friedrich von Wieser were united in a community of studies and an unbroken friendship which dated back to the first form of the Gymnasium. These two were the first who took up and developed the exact economic theory which Carl MENGER had published in his *Grundsätze der Volkswirtschaftslehre*, 1871, but which had till then remained almost unnoticed. Böhm-Bawerk's extraordinary intellectual vigour enabled him, in addition to his rich and varied scientific work, to do as much as an official and statesman as would have completely filled the life of a less gifted man.

On completing his studies, Böhm-Bawerk went into the Austrian Ministry of Finance, then qualified in 1880 as a Privatdozent (lecturer) in Political Economy in the Vienna University, and in 1881 became Assistant Professor, and later Professor of this faculty at Innsbruck. In the few years that he taught there, he completed the two volumes of his chief work, *Kapital und Kapitalzins*, which brought him an international reputation. In 1889 he was called to Vienna as an expert in the Finance Ministry in order to draft the Government bill for the reform of direct taxation. Austria at that time had a system of direct taxes on produce, which had mainly been introduced as war taxes. Their assessment and method of collection were consonant neither with justice nor good policy in taxation. Böhm-Bawerk's bill remedied the worst defects of these taxes on profits and also introduced a modern income tax. His political tact enabled him to steer the bill through the difficulties of Parliament. His sound judgment and foresight were proved by the great success which attended the reformed taxes, both in their financial yield and the extraordinary improvement they produced in taxation morale. From 1895 onwards, Böhm-Bawerk was three times Finance Minister. On the first two occasions he held office only a short time; but the third time, in 1900, it was his fortune to hold office for almost five years. In the interval between his periods of office he was one of the Presidents of the Administrative Court of Appeal (*Verwaltungsgerichtshof*) as the head of the Tax Division.

Böhm-Bawerk's successes as a statesman were a brilliant refutation of the criticisms brought against the Austrian theory for its hyper-abstraction and lack of connection with real life. Without the clearness which his scientific training imparted he would not have made so great a success. When he retired from office, he left to his successors a well-organised state household, a well-filled exchequer and a brilliant budget. The Austrian State credit had so much improved that Böhm-Bawerk had been able to carry out a conversion of the public debt. The Government offered the retiring Minister the highly paid post of a Governor of the Austrian Mortgage Bank (*Bodenkreditanstalt*). He, however, declined this offer in order to devote himself entirely to his scientific work, and took a professorship at Vienna which he held till his death.

Böhm-Bawerk's scientific work has a twofold content. First of all he did great service in using his brilliant powers of exposition to make known the doctrines of the AUSTRIAN SCHOOL to a wider circle of readers at home and abroad. His first publication of this sort was the *Grundzüge der Theorie des wirtschaftlichen Güterwertes* (Principles of the Theory of the Economic Value of Goods), which appeared in the *Jahrbücher für Nationalökonomie*, Jena, 1886. Here he united the doctrines developed by Carl Menger and Friedrich von Wieser, successfully widening their scope in regard to the theory of prices. His rare critical gifts enabled him to defend the Austrian School against the many attacks to which it was exposed in the early days of its existence. At the same time, he gave proof of his vigour in debate by a constant discussion and criticism of the new works on the theory of value, price and capital. Of the controversies he carried on,

the most to be noted are that with Dietzel in the *Jahrbücher für Nationalökonomie*, Jena, 1890-92; with Josef Schumpeter in the *Zeitschrift für Volkswirtschaft*, Vienna, 1913; and with John B. Clark in the *Quarterly Journal of Economics*, vol. ix.

The main theme of his scientific work is the subject of capital and interest. The first volume of his chief work shows him in his full mastery of fertile criticism. In the whole range of the moral sciences there is no history of the development of thought which presents its material with more power of insight and persuasion. The second volume develops the theory of capital, and, above all, of interest on capital. The Austrian theory of value and price is here used as a basis and its most important problems searchingly examined. Böhm-Bawerk's theory of interest is based on the idea that future needs are put low in proportion to their remoteness, an idea which introduces the time-factor into economic calculation. Böhm-Bawerk's theory of interest has found staunch adherents and obstinate opponents in equal numbers. But even if one disagrees with its root idea, it is impossible not to recognise the profound insight which Böhm-Bawerk acquired in his researches in economic theory.

[Cf. Carl Menger's obituary of Böhm-Bawerk in the *Almanach der Wiener Akademie der Wissenschaften*, 1913. It gives a list of his writings and the most important articles, etc., on his economic work. Cf. also Joseph Schumpeter's brilliant obituary, entitled "The scientific life-work of Eugen von Böhm-Bawerk," published in the *Zeitschrift für Volkswirtschaft*, Vienna, 1914. Cf. also the article on AUSTRIAN SCHOOL OF ECONOMISTS.] F. W.

BOOTH, CHARLES (1840-1916), shipowner, merchant, manufacturer and investigator, was born and educated at Liverpool. He received his business education in the office of Mr. Lamport of Messrs. Lamport & Holt's Steamship Company. He then joined his brother Alfred in a business in America. In 1866 the two brothers invested the whole of their fortune in the purchase of two steamships, the small beginning of the large undertaking afterwards known as the Booth Steamship Company. In early youth he was an enthusiastic Radical and a member of the Birmingham Education League. While working excessively long hours for the success of his business, he gave much time and thought to the affairs of the Liverpool Trades Hall. He was at the time greatly influenced by the writings of Comte, but never joined the Positivist body. In 1871 he married Mary, daughter of Charles Zachary Macaulay. Owing to overwork he had become subject to a form of nervous indigestion which compelled entire rest for more than two years, part of which he spent in Switzerland. In 1876 he went on one of his company's steamers to Brazil to test the working of a small boiler with a very small consumption of coal; the long sea voyage renewed his health, and although always limited to an abnormally abstemious diet, his health ceased to stand in the way of exertion for many years. Living in London, he took part in discussions among the Socialists and at Toynbee Hall and Oxford House, and attended the meetings of the Social Democratic Federation, himself giving an address on the best principles of land ownership. He became convinced that no true remedies for social evils could be discovered until their conditions had been investigated and analysed. He turned first to the statistical material at hand, and in 1886 read a paper to the Royal Statistical Society on the *Occupations of the People of the United Kingdom, 1801-81*. Deciding that personal observation should precede general statistical summary, he started on his long and costly survey of the conditions of the people in London, intending at first to limit his investigations to East London. In its final form the work falls into three series, under the title of *Life and Labour of the People in London*, the first, *Poverty*, consisting of four volumes; the second, *Industry*, of five volumes, and the third, of seven volumes, under the generic title, *Religious Influences*. A seventeenth volume, *Conclusions and Survey*, completed the work. The celebrated Descriptive Map of London Poverty, showing the streets coloured according to the general conditions of the inhabitants, forms part of the first series. The statistical basis of his social classification of the people was found in the records kept, for their official schedulings, by the Visitors of the London School Board. The execution of the scheme required the response of large numbers of departments, authorities, organisations and individuals—employers, Trade Union officials, workers, administrators, clergy, and those engaged in social and charitable activities. The work, although scientific in character, had the direct end of providing a body of analytical fact that could be put to practical uses. The first volume was published in 1889, the last in 1903. In the meantime he had become the responsible head of his firm; this entailed yearly visits to the United States—sometimes more than one—and occasional visits to Brazil. Also during those years he began his crusade in favour of pensions for the aged, making his proposals for universal non-contributory pensions in 1891 and attaining a partial success by the passing of the Old Age Pensions Act, 1908; he disliked the poverty qualification laid down by it. Greatly interested in fine art, he bought Holman Hunt's replica of the "Light of the World" and sent it on a tour round the Empire; on its return it was accepted by the Dean and Chapter of St. Paul's to take its place in the Cathedral. In 1904 he was appointed a member of the Privy Council.

From 1905-7 he gave much time to his duties as a member of the Royal Commission on Poor Laws, but owing to ill-health resigned before the consideration of the Report. He supported Joseph Chamberlain's Fiscal Policy and joined the Unionist party, but "he was anything but a good party man." He was an enthusiast in his business life, and said "that no leader of a great merchant enterprise was worth his salt whose mind was not for some part of every day living in a time three or four years ahead and who was not mentally preparing himself to face the exigencies of that distant time." In 1913, in a pamphlet on *Industrial Unrest and Trade Union Policy*, he gave a glimpse of the characteristic qualities which he knew business demanded. "Enterprise, however maintained and controlled, is the dominant factor in every undertaking. Capital relies on past accumulation, labour on present activities, and enterprise on future results. Successful industrial enterprise finds its normal reward and the measurable test of its industrial success in profit. Loss is the normal and measurable penalty of failure." "Capital is wealth transmuted and vitalised by industrial enterprise." Enterprise includes "forethought, guidance, the capacity to plan, the nerve to execute, the whole genius of mind and character." Thus defined, Charles Booth's endowment of this quality was of the highest order; from first to last the material success which was its inevitable accompaniment presented to him "the problem of poverty in the midst of wealth." He possessed marked intellectual courage, great kindness of heart and wide sympathies. To an exceptional degree he possessed the power of recognising and respecting human personality, and his interest in its ordinary manifestations never flagged.

He was elected a Fellow of the Royal Society; honorary degrees were conferred on him by Cambridge, Oxford, and Liverpool; he was a member of the Political Economy Club and the Economic Club. Elected a Fellow of the Royal Statistical Society in 1885, he served on its Council from 1886, first as member, then as President, and afterwards as Hon. Vice-President until his death. He invariably submitted the statistical methods and results of his inquiries to the Society for criticism before publication in their final form, and from 1886 to 1894 its Journals contain the best records of his work and the value attached to it by his contemporaries.

BOUNTIES ON SUGAR.* A conference on sugar bounties was summoned by the British Government to meet in London in 1887, and a Convention was signed in 1888 by Austria, Belgium, Germany, Great Britain, Italy, the Netherlands, Russia, and Spain. The countries signing the Convention agreed to abolish all direct and indirect bounties and to impose prohibitive duties on bounty-fed sugar. The Convention was not, however, ratified, and in 1896 the bounties offered by the Governments of Germany and Austria-Hungary were roughly doubled. In 1898 a fresh conference was held at Brussels for the purpose of establishing a sugar convention. Difficulties arose, however, over the fact that the British delegates were not authorised to consent to a system which would place countervailing duties on bountied sugar. Moreover, France would not agree to the abolition of all bounties, and Russia refused to join the conference on the ground that her fiscal arrangements were not equivalent to a bounty on the export of sugar. Negotiations therefore lapsed, but in 1901 another conference was summoned at Brussels by the Belgian Government. As a result of this conference a Convention was signed between Germany, France, Austria-Hungary, Great Britain, Belgium, Holland, Italy, Sweden, and Spain, Russia refusing to take part in the arrangements. It was agreed that all direct and indirect bounties should be removed; the excess of the import duty over the excise was fixed; and the obligation was placed upon all countries signing the Convention to place an additional tax on all bounty-fed sugar. The Convention was ratified in 1903 and was intended to last for five years. In 1907 Russia was admitted to the Convention under special conditions. Great Britain agreed that the British differential duties should lapse, and Russian sugar be admitted on equal terms. Denunciation of the Convention was demanded by certain members of Parliament, who maintained that the duties on bountied sugar had raised prices. Finally in 1913 the British Government withdrew from the Convention.

Much attention has been devoted to the relation between the bounties on sugar and the West Indian sugar trade. It is noticeable, however, that of the Commissioners who were sent to report in 1897 only one asserted that

the bounties had been the real cause of the downfall of the West Indian trade.

E. L. H.

BUDGET.* The Budgets of the three years following 1910-11 made no important changes.

That of 1912-13 showed the largest realised surplus then on record of £6⅛ millions. In 1914-15 the national expenditure reached for the first time £200 millions. The expenditure which the Chancellor had to meet was £206 millions; the anticipated revenue fell short of this figure by £5¼ millions. Income Tax and Super-Tax were increased, as were the rates of the Estate Duties. The increases were to produce an additional revenue of about £6½ millions. The outbreak of the Great War in August of that year rendered necessary a Supplementary Budget in November. Reductions in revenue due to the war were expected to amount to £11 millions; £325 millions were required for war purposes. This was provided by Votes of Credit, a war-time expedient which enables the Government to make provision for expenditure as and when required, without the necessity of submitting detailed estimates to the House of Commons. The duty on tea was increased from 5d. to 8d. per lb., the duty on beer was raised, subject to certain rebates, to £3 : 9s. for every 36 gallons of a specific gravity not exceeding 1215 degrees, and to £4 : 0 : 10 where that figure was exceeded. Income Tax and Super-Tax rates were doubled. The additional taxation was expected to produce £10 millions, leaving a deficit of £323½ millions to be met by borrowing. The total provision for the year was £532½ millions. The addition to debt in the year was £458 millions.

In 1915-16 an expenditure of £1132½ millions was anticipated, of which £978 millions was required for the Votes of Credit. Proposals were made for increases in the duty on beer and wine, but were abandoned. The New Sinking Fund was suspended. The revenue was expected to amount to £267¼ millions. The deficit of £862¼ millions was to be found by borrowing. In September of that year Mr. M'Kenna, who had succeeded Mr. Lloyd George as Chancellor, introduced a Supplementary Budget, the total required for the year being then £1590 millions. The Votes of Credit amounted to £1420 millions. The duties on tea, coffee, cocoa, etc., were increased by one half; the duty on sugar was raised from 1s. 10d. per cwt. to 9s. 4d. per cwt. or 1d. a lb.; 3d. a gallon was added to the duty on motor spirit; the duty on patent medicines was doubled. An *ad valorem* duty at the rate of 33⅓ per cent was raised upon imported motor cars, cinema films, clocks, watches, musical instruments. These duties were stated to be intended as a war measure for the protection of foreign exchange and the restriction of imports of luxuries. They became known as the "M'Kenna duties." The rates of Income Tax were increased by 40 per cent for the second half of the year. Increases were made in the Super-Tax rates on incomes over £8000. A new tax of 50 per cent was imposed on the Excess Profits over pre-war standards, in trades, manufactures, and businesses. It was called Excess Profits Duty. The additional taxation was expected to produce £31 millions in the year and £102 millions in a full year. The deficit to be made good by borrowing was £1284½ millions. The addition to debt in the year was £1032 millions.

In 1916-17 the expenditure of the year had risen to £1825¼ millions, of which £1600 millions, including £450 millions for advances to Allies and Dominions, were required for Votes of Credit. Customs and Excise duties were still further increased, the main increase being in sugar, the duty on which was raised from 1d. a lb. to 1½d. A new duty was imposed on admission to entertainments, which was expected to yield £5 millions, and a duty was placed on matches. A railway fare duty was proposed but withdrawn. Income Tax rates were raised to a maximum of 5s. in the £ on earned income exceeding £2500 and unearned income exceeding £2000. Excess Profits Duty was raised from 50 per cent to 60 per cent. The estimated yield for the year of the increases in taxation was £73 millions. In this year the amount required for debt services rose to £125 millions. £1323 millions were to be found by borrowing. The addition to debt in the year was £1870 millions.

By 1917-18 Mr. Asquith's Government had been replaced by that of Mr. Lloyd George, and Mr. Bonar Law, who had succeeded Mr. M'Kenna as Chancellor, had to provide £2290½ millions. Votes of Credit reached the figure of £1975 millions. Revenue on the existing basis was expected to amount to £612½ millions. Increases were made in the duty on tobacco and in the Entertainments Duty. The rate of Excess Profits Duty was increased from 60 per cent to 80 per cent. The increase in the Tobacco Duty was expected to bring in £6,000,000; Entertainments Duty an additional million, and Excess Profits Duty a further £20,000,000—a total of £27,000,000. Against this there was an extension of the rebate in connection with the higher Licence Duties costing £1,000,000. It was necessary to borrow £1651½ millions. The addition to debt, which reached £5870 millions in the year, was £1860 millions. Debt services required £211 millions.

In the following year 1918-19 the peak of the national expenditure was reached. Mr. Bonar Law had to find £2972 millions. Revenue on the existing basis was put at £774¼ millions. Votes of Credit amounted to £2550 millions. The duty on spirits was doubled, as was the duty on beer. Increases were made in the duty on tobacco. The Sugar Duty was raised from 1½d.

a lb. to 2¾d. a lb. An increase was made in the Match Duty. Income Tax was raised from 5s. to 6s., and increases were made in Super-Tax, the limit being lowered to £2500. Some relief was granted to the taxpayer by a concession allowing him to pay Income Tax, Schedule A, by instalments. The 1d. Stamp Duty on Bills of Exchange and cheques was raised to 2d. These increases were expected to yield in this year £68 millions, and in a full year £114 millions. Further, the postage on the 1d. letter was raised to 1½d. and on the ½d. postcard to 1d. The yield of taxation was estimated at £842 millions, leaving £2130 millions to be provided by borrowing. Debt services required £268 millions. £1563 millions were added to the debt, which reached £7434 millions by the end of the year.

The war came to an end on the 11th November 1918.

The total issues from the Exchequer from 1st April 1914 to 31st March 1919 were £9,590,000,000. The money was raised approximately as follows:

From direct taxation	£1,820,000,000
From indirect taxation and other sources of revenue	£910,000,000
By borrowing at home	£5,500,000,000
By borrowing abroad	£1,360,000,000

In 1919-20 Mr. Austen Chamberlain had succeeded Mr. Bonar Law, who had been compelled by ill-health to retire. He had to provide £1435 millions. The Votes of Credit disappeared and there was borne on the estimates, which were consequently quite abnormal, the whole of the charges for remanent war expenditure. Revenue on the existing basis was put at £1159½ millions, including £200 millions from the proceeds of the sale of assets not appropriated in aid of votes. The deficit was therefore £275 millions. The duty on spirits was raised from 30s. to 50s. per proof gallon, and an increase was made in the duty on wine. Beer duty was raised from 50s. to 60s. per bulk barrel. In this year Imperial preference was established in pursuance of a declaration made two years previously by the Imperial War Conference. A preference of ⅓ was given as regards the articles subject to the M'Kenna Duties and of ⅙ on the articles subject to revenue duties pure and simple; the most important articles concerned were tea, cocoa, sugar and rum at an estimated cost of £3 millions in a full year. There were increases in the duty on estates over £1500, but the Excess Profits Duty was reduced to 40 per cent as from January 1919. The additional taxation imposed was expected to produce £41 millions in the year, £109 millions in a full year. The total estimated revenue was therefore £1201 millions, leaving £234 millions to be covered by borrowing. Debt services required £360 millions. The addition to debt in the year was £397 millions. In October the Chancellor, without introducing a new budget, presented revised estimates showing increased expenditure of £191 millions and decreased revenue of £32½ millions, making the deficit to be covered by borrowing, £473½ millions. This was the last year of Government borrowing of new money.

In 1920-21 there was a small decrease in the national expenditure, the amount required being £1418¼ millions, of which £234 millions were set aside for debt reduction. Debt services amounted to £320½ millions. Revenue on the existing basis was put at £1341½ millions, including £320 millions from sale of assets. There was further increase in the duty on spirits, which was raised from 50s. to 72s. 6d. The duty on beer became £5 a barrel. The duties on wines and imported cigars were increased. There were some alterations in the motor vehicle duties. Excess Profits Duty was raised from 40 per cent to 60 per cent and a new tax, called Corporation Profit Tax, of 1s. in the £ on the profits of Limited Liability Companies was imposed. Stamp duty on share capital was increased from 5s. to 20s., and the stamp on marketable securities doubled. The Post Office were faced with a deficit of £11,000,000 on the year's working. The service had in fact become, owing to increased cost of handling the business, a subsidised service. The charges, therefore, were increased. The 1½d. letter became a 2d. letter and telephone charges were rearranged. Land value duties were repealed. The increases were expected to produce £76½ millions in the current year and £198¼ millions in a full year. Effect was in this year given to certain recommendations of the Royal Commission on Income Tax as to family reliefs and double income tax at a cost of £5 millions in the current and £20 millions in a full year. Debt, which was £7831 millions, the highest recorded, at the beginning of the year, was decreased by £246 millions.

In 1921-22 Mr. Austen Chamberlain again presented the budget, though he had in fact been succeeded shortly before its introduction by Sir R. Horne. He required £1058 millions, in which figure was included a surplus of £84 millions. He allowed Excess Profits Duty to lapse, but otherwise there was no change in taxation.

In 1922-23 Sir Robert Horne anticipated expenditure of £910 millions, including £25 millions for supplementary estimates. Revenue on the existing basis was estimated at £956½ millions, and the Chancellor thus found himself with a surplus of £46½ millions. He took 4d. off tea at a cost of £5 millions; 1s. off Income Tax, which cost £32½ millions in this year and £52 millions in a full year; the letter rate was reduced to 1½d. and the postcard to 1d., and some concessions were made to telephone

users at a cost of some £5½ millions. This year ended with a surplus of no less than £101½ millions.

In October 1922 the Coalition Government came to an end.

In 1923-24 Mr. Baldwin budgeted for £818½ millions. In the preceding January the agreement for funding the American debt had been arrived at with the government of the United States of America. The debt, including the capitalised arrears of interest on the American debt, was £7772 millions. The Chancellor established the new Sinking Fund (1923) by which a provision was made for £40 millions in this year for debt redemption, rising to £45 millions in the following, and to £50 millions in subsequent years. Debt charges including the new Sinking Fund were £850 millions.

Revenue on the existing basis showed a surplus of £36 millions, which was employed as follows:

The Chancellor gave a rebate of £1 per barrel on beer at a cost of £13 millions in the current and £16½ millions in a full year. He repealed the small duty on cider, and made a reduction in the Table Water Duty. He reduced Income Tax from 5s. to 4s. 6d. at a cost of £19 millions in the current and £26 millions in a full year; Corporation Profits Tax from 1s. to 6d. at a cost of £2 millions in the current and £12½ millions in a full year. He also made some reductions amounting in a full year to £2½ millions in postal charges. A betting tax was discussed and referred to a Select Committee. The size of the surplus, which had, of course, been used in debt redemption, and the Chancellor's proposals for the new Sinking Fund gave rise to a discussion as to the relative merits of debt and tax reduction from the point of view of the encouragement of trade. The claim of tax reduction against debt reduction was urged by a section of the Liberal Party and found some adherents amongst the Chancellor's own supporters. The Chancellor's proposals were, however, criticised by the Labour Party on the ground of the insufficiency of the amount set aside for debt redemption, and he had no difficulty in carrying his plan. The main demand of the opposition was for a reduction of the Sugar Duty. The Chancellor resisted it successfully on the ground that owing to the state of production any reduction would benefit the producer and not the consumer.

In the autumn of 1923 Mr. Baldwin, who had become Prime Minister in the preceding May, went to the country on Protection and resigned in January 1924, on finding himself without an absolute majority over the other two parties. 1924-25 saw the first Labour Budget. Mr. Snowden wanted £794 millions, including a £4 millions surplus. He found himself with £38 millions to dispose of. He took 4d. a lb. off tea, with the consequential reductions on coffee, cocoa, etc., thus bringing the duty below the pre-war level, at a cost in a full year of £5½ millions. He took 1⅓d. off sugar, at a cost in a full year of £18½ millions. He swept away the duty on dried fruits. He abolished the Entertainments Duty on seats costing less than 6d., making a reduction in the duty on seats between 6d. and 1s. at a cost of £4 millions in a full year. Less important financially, but of greater political importance, was the abolition of the M'Kenna duties. He made some small concessions on motor vehicle duties. He removed the remaining 6d. of Corporation Profits Tax and repealed the Inhabited House Duty (£2 millions). Finally, he made some further concessions to telephone users. His proposals raised some discussion as to the proportion which should be borne by direct to indirect taxation, a question to which much attention had been given in the last decades of the previous century. Mr. Asquith's opinion, however, that the difficulty of determining the ultimate incidence of a tax and other considerations which had since emerged had deprived the subject of much of its importance, found general acceptance. The main criticism was directed to the abolition of the M'Kenna duties, which was strongly opposed by the Conservative Party on the ground of its effect upon unemployment, and the absence of proposals for increases in Imperial preferences which the late Government had agreed at the Imperial Conference in the preceding autumn to place before Parliament.

H. E. F.

BUILDING SOCIETIES.* The Reports of Mr. G. S. Robertson, K.C., the Chief Registrar of Friendly Societies, on the returns of Building Societies for the year 1921, furnish the latest available information relating to those societies. From those returns inferences may be drawn as to the effect of the war on the prosperity of the societies, and the public service they are capable of rendering in meeting the shortage of building which was one of the consequences of the war. For this purpose, the returns of 1913 (pre-war), 1917 (war), and 1921 (post-war) may conveniently be compared. These were furnished by 1610, 1418, 1225 societies respectively, showing that the diminution in the number of societies (due in the main to the terminating societies coming to their natural end) still continues. The number of members was 625,523: 620,607: and 789,052 in the three years referred to; the total amounts received by the societies were respectively £23,391,672, £22,288,050, and £47,146,705. The amount advanced to members was (in 1913) £9,244,570, (in 1917) £4,555,984. (in 1921) £19,673,408. The liabilities and assets were as follow:

	1913.	1917.	1921.
Liabilities—	£	£	£
To Shareholders	46,232,642	47,183,470	70,861,612
To Depositors and other Creditors	16,192,482	13,812,207	19,072,003
Net Balance undivided . .	3,882,709	4,260,191	5,331,659
	66,307,833	65,255,868	95,265,274
Assets—			
Mortgages . .	61,639,132	55,249,802	75,503,123
Other Assets .	4,668,701	10,006,066	19,762,151
	66,307,833	65,255,868	95,265,274

From these figures, it appears that the effects of the war upon Building Societies, though noticeable, were much less than might have been expected. The shareholders managed to keep up their payments. The amounts withdrawn by depositors were soon replaced. The profits were maintained. Though the fresh advances on mortgage were comparatively few, the "other assets," which were probably mainly patriotic investments in the securities created by Government to meet the expenses of the war, were largely increased. Some other interesting points may be inferred from the following analysis of the mortgage assets at the three years in question :

Mortgages.	1913.	1917.	1921.
	Per cent.	Per cent.	Per cent.
Under £1000 . . .	71·0	73·8	79·0
£1000 and over . .	24·2	22·7	20·2
Properties in possession and in arrear over 12 months . . .	4·8	3·5	0·8
	100·0	100·0	100·0

When the great increase in the cost of house property of late years is taken into account, it will appear that the business of Building Societies has been principally among the holders of small properties, and that its tendency has reverted to their original purpose of helping the small investor to acquire his dwelling-house. The most satisfactory feature in the returns is the diminution in the item of properties in possession or in arrear for more than 12 months. In 1896 they amounted to £6,322,172, or 14·6 per cent of the then mortgage assets; in 1921 they are only £529,264, or less than 1 per cent; the steady diminution during the whole period having been due to good management.

The Building Societies Association, which has been established fifty-five years, has been of great service to the societies in promoting amendments of the law, and in watching over the interests of the societies when legislation that may be prejudicial to them has been proposed in other quarters. The late Lord Avebury was its president for many years, and is now succeeded in that office by Lord Emmott. At the annual meeting of the Association held at York in 1923, a report was presented on the Housing problem, containing the recommendations of the Committee of the Association for dealing with it. These have for object the restoration of public confidence in house property as an investment, the inducing and assisting investors and purchasers for occupation to meet the shortage, and the provision of funds for the erection of suitable dwellings on approved sites. The Committee recommended that house property should be relieved of some of the burdens which now press heavily upon it, and that in any scheme for organised or assisted house building, the machinery of Building Societies should be utilised. The facts above given as to the success which has attended these voluntary and self-supporting bodies in accumulating a vast sum by the subscriptions of their members, in assisting them to purchase their own dwellings, in meeting the strain of war with so little difficulty, in repairing its damage so expeditiously, and in strengthening their position, should establish a claim on their part, not merely to be consulted, but to be looked upon as necessary agents in the carrying out of any measures for providing suitable dwelling-houses for a growing population. E. W. B.

BUREAU OF LABOUR.* See also LABOUR DEPARTMENT, LABOUR EXCHANGES, in Vol. II., and UNEMPLOYED, Appendix, Vol. III.

BUREAU OF LABOUR IN THE UNITED STATES.* In some states functions pertaining to labour information similar to those described in the original article were assigned at first to other state officials—as to a commissioner or secretary of agriculture, education, or industry—and gradually in every state some sort of labour authority was created. Since 1910, with the growth of factory legislation, factory inspection, and more particularly workmen's compensation laws, other functions, such as factory inspection, in some cases mine inspection (though usually kept in separate bureaus), and administrative duties of various kinds, also in many cases powers of mediation, conciliation, and arbitration in industrial disputes, have been added or combined with the statistical and information services of the various state labour bureaus. More recently, and notably in Wisconsin, New York, Pennsylvania, Ohio, Oregon, and Washington, state industrial commissions, with quasi-legislative (rule-making power), judicial, and administrative powers, have been created, in which all of these functions are combined and the older type of labour bureau incorporated.

The industrial commissions and the labour bureaus in the larger industrial states are usually provided with large appropriations and

with extensive legal powers, and the scientific value of their reports and of special investigations made from time to time under their direction or with their co-operation is very considerable. The three Reports (10 vols.) of the New York Factory Investigating Commission (1913-16) is an illustration.

The early work and reports of most of the bureaus (Mass. is an exception), and even to date those of many bureaus in the less important industrial states, are inconsequential. Such bureaus have meagre financial resources and few legal powers, but they will develop in time along the lines laid down by the larger and stronger organisations of a similar character.

The national bureau of labour statistics is better equipped than any of the state bureaus. It is now an important division of the Federal Department of Labour, established by act of 4th March 1913, under the direction of a Secretary of Labour, who is a full cabinet officer. The Department of Labour is the successor, as far as labour functions are concerned, to the former Department of Commerce and Labour, now the Department of Commerce, established by act of 14th February 1903, but with much enlarged resources, powers, and duties, including important administrative functions with respect to immigration and many matters pertaining to the welfare of wage earners.

The present bureau of labour statistics has therefore successively had the titles of Bureau of Labour, Department of the Interior, Department of Labour, without the status of an executive department; Bureau of Labour, Department of Commerce and Labour, and Bureau of Labour Statistics, Department of Labour. Throughout its history since 1885 it has done valuable work, and its voluminous publications constitute the most complete and authoritative source of information we have on labour conditions in the United States. It has published many valuable reports, including twenty-five Annual Reports, discontinued in 1910 (1886-1910), such as that on Industrial Depressions (1886), Convict Labour (1886 and 1905), Strikes and Lock-outs (1887, for the period 1881-86; 1894, for period 1887-94; 1901, for period 1881-1900; 1906, for period 1901-1905), Cost of Production (1890 and 1891), Cost of Living (1903), Industrial Education (1910); twelve Special Reports, discontinued in 1905, such as Marriage and Divorce (1889), Housing of Working People (1895), Labour Laws of the United States (1904); Miscellaneous Reports, most of which now appear in a series of bi-monthly bulletins —No. 1, Nov. 1895, to date (No. 319, Oct. 1922, entitled Bureau of Labour Statistics, U.S. Department of Labour, its history, activities, and organisation, contains a complete chronological list of publications of the bureau). The most important of the Miscellaneous Reports, made under special appropriation and authorisation of Congress, is that on Condition of Woman and Child Wage-earners in the United States (1910-12, 19 vols.), and next that on Conditions of Employment in the Iron and Steel Industry in the United States (1911, 4 vols.).

Since 1915 the bureau has published *The Monthly Labour Review*, giving information concerning the current work and publications of the bureau and of other agencies of the federal and state governments, and of foreign countries, which relate to labour matters; also information from other sources having a bearing upon labour in all parts of the world. A cumulative index of *The Monthly Labour Review*—July 1915 to December 1920—was published by the bureau (1923), and a subject index of the publications of the bureau up to 1st May 1915 (Washington, 1915; 233 pp.).

[Reports of the various bureaus (generally annual, in some cases biennial).—Proceedings of convention of the chiefs of labour bureaus (annually since 1883).—*Political Science Quarterly*, vol. i. 1886, pp. 45 *seq.* and 438 *seq.*] S. M. L.

BUTT, Isaac (1813-79), born at Glenfin, Donegal, scholar of Trinity College, Dublin, during his collegiate course showed great ability in classical studies. He succeeded M. Longfield as Whately professor of Political Economy at Dublin 1836-41, and accepted his predecessor's conclusions on the productivity theory of wages and the marginal productivity theory of interest in economic science. (See Longfield, Vol. II. and Appendix.)

Butt repeated and developed the doctrine in a monograph entitled *Rent, Profit, and Labour*. Professor Seligman tells us that the theory of marginal productivity as applied to capital and labour "seems obvious and simple enough, but until the appearance of Dr. Longfield's letters it was not thought of." Butt was called to the Irish Bar in 1838, and to the English Bar, Inner Temple, in 1859. Of his ability and brilliancy as an advocate, or of his association with politics and his parliamentary career, we cannot speak at any length here. He is stated to have been the first to have used Home Rule as an effective election cry, and to have been probably the inventor of the phrase. Latterly he found himself unable to manage the party he had created. The treatment he received almost broke his heart.

Butt wrote—*Rent, Profits, and Labour: A Lecture delivered before the University of Dublin in Michaelmas Term, 1837* (Dublin, 1838), and a larger *Introductory Lecture delivered before the University of Dublin in Hilary Term 1837*, Dublin, 1837. In this he follows Say in defining production as the "creation of utility," rather than the "creation of value," and is especially severe on those economists who wish to limit the term wealth to material objects Immaterial, like material,

objects are equally forms of wealth. He also objects to identifying capital with the instruments of production. His writings on other subjects are numerous and able.

[Prof. E. R. A. Seligman—"On some Neglected British Economists," in the *Economic Journal*, London, 1903.—*The Dictionary of National Biography*.]

CAIRD, Sir James (1816-1892), was born at Stranraer and educated at the high school at Edinburgh. He went to the University, but left after a short time in order to learn farming in Northumberland. In 1841 he took a farm near Wigtown. His first important work was published in connection with the repeal of the Corn Laws and the Free Trade controversy. The reputation he gained by championing the cause of free trade in his *High Farming as the Best Substitute for Protection* caused him to be appointed by the Government to visit the South and West of Ireland and to make a report on the country. This report, which took an optimistic view of Irish agriculture, was published in an expanded form in 1850 as *The Plantation Scheme, or the West of Ireland as a Field for Investment*. In 1850 *The Times* instituted an investigation into the effects of free trade on the economic difficulties of British farmers. Caird, who was appointed principal commissioner in this investigation, wrote letters during the year 1850 giving a survey of agriculture. These letters were published in 1852 under the title *English Agriculture in* 1850-51. At the General Election of 1852 Caird stood as a Liberal for Wigtown, and was defeated; but he was returned at the General Election of 1857 as member for Dartmouth. In 1857 he introduced a Bill to make provision for the collection of agricultural statistics in England and Wales, but his proposal did not meet with success until 1864. In 1858 he travelled to America and visited Canada and the United States. On his return he published the result of his experiences in a work entitled *Prairie Farming in America, with Notes by the Way on Canada and the United States*. In 1859 he stood for Stirling as a Liberal and was returned unopposed. In the following year he was appointed a member of the Fishery Board. In 1863 he was made chairman of the Royal Commission appointed to investigate the condition of the sea fisheries in the United Kingdom, and in this capacity inspected some of the principal fishing centres. At the same time he made the acquaintance of John Bright through his motion for the appointment of a committee to investigate the possibility of securing an additional supply of cotton from India. On the failure of his motion he travelled to Algeria, Italy, and Sicily in order to study the problem of the supply of cotton. In 1865 he received appointment as Enclosure Commissioner and withdrew from Parliament. As a result of a second visit to Ireland in 1869 he published a pamphlet entitled *The Irish Land Question*. In 1875 he was elected a Fellow of the Royal Society. On the appointment of a commission to investigate the causes of the Indian famine of 1876-7, Caird, who was nominated as a member, visited India, and after his return published his views in *India, the Land and the People*. In 1880 he became president of the Statistical Society, and in 1881 was re-elected. In the following year he became a member of the newly appointed Land Commission. In 1886 he was appointed to serve on the commission formed to investigate the agricultural situation in Ireland. In the Board of Agriculture, constituted in 1889, he became director of the Land Department, and was made at the same time Privy Councillor. He abandoned his post in the Board of Agriculture in 1891.

Caird published—*High Farming as the Best Substitute for Protection* (Edinburgh, 1849); *English Agriculture in 1850-51* (London, 1851); *Prairie Farming in America* (London, 1859); *The Plantation Scheme, or the West of Ireland as a Field for Investment* (London, 1850); *Our Daily Food, its Price and Sources of Supply* (London, 1868); *The Irish Land Question* (London, 1869); *The Landed Interest and the Supply of Food* (London, 1878); *The British Land Question* (London, 1881); *India, the Land and the People* (London, 1883).

E. L. H.

CANALS.* The policy of development of inland water transport was revived in 1905, when a Bill was introduced into Parliament with the intention that the State should take over and control the chief waterways of the country. As a result of the agitation that arose, a Royal Commission was appointed in 1906 and instructed to consider (1) The existing condition of the canals of the country, (2) The causes hindering the carrying out of improvements, (3) The improvements required in order to complete a thorough system of communication between the principal centres, (4) The prospect of benefit to the trade of the country compatible with a reasonable return on the probable cost, (5) The expediency of canals being made or acquired by public bodies or trusts. The fourth and final report of the Commission was issued in 1910. It recommended the appointment of a Central Waterway Board for Great Britain, the unification of the existing waterways and their transference to the administration of the proposed Board. The financial recommendations were based on the methods already adopted

under the Port of London Act (1908). Stock would be issued by the Waterway Board to the various canal companies for the purpose of acquiring their properties. It was also held that some form of financial assistance should be provided by the State in order to bring about the restoration of the canal system. So far as practical improvements were concerned, it was suggested that the four main routes connecting the Midland district with the Thames, Mersey, Humber and Severn ("The Cross") should be amalgamated and brought into working order. No steps were taken, however, to carry out the recommendations made in this report. It was felt in many quarters that the scheme proposed was a vain attempt to resuscitate a dying system of transport and would probably involve the State in a serious financial loss. These objections were applicable alike to nationalisation, municipalisation, or a system of public trusts.

On 1st March 1917 the Government took over the control of the chief independent canals, and a Canal Control Committee was formed. Under this scheme the canal companies were guaranteed the net revenue they earned in a standard year (usually 1913). In 1920, when State control ceased, a Committee was appointed under the presidency of Mr. Neville Chamberlain to review the situation. This Committee was instructed to consider whether any portions of the canal system of the country should be acquired by the Ministry of Transport with a view to their improvement. If acquisition were recommended, it had also to report whether the acquired portions should be owned by the State, by a regional Trust, or in some other form ; and by what means improvements should be carried out in these portions. The Committee recommended the grouping of the canals on the lines of the grouping of the railway system, and the formation of public trusts aided partly by the State, partly by local authorities. Reservations were made by Sir W. Acworth, who pointed out the unremunerative nature of the vast improvements made on the Erie Canal. It was generally recognised that the economic working of the canal system, as a means of transport over long distances, was not possible, and that its restoration would necessitate State assistance on a large scale. The recommendations of the Committee have therefore shared the fate of those of the Commission of 1906-10.

E. L. H.

CENSUS.* The demands for the improvement of the Census which, as mentioned in the earlier article, had been repeatedly urged are now receiving attention. Some progress in the co-ordination of imperial statistics was made by the Imperial Statistical Congress which met in London, 1920. The quinquennial census has at length been instituted, or at least made possible. By the Census Act of 1920 His Majesty in council may direct from time to time that a census shall be taken for Great Britain, or any part of it, but not unless at least five years have elapsed since the commencement of the year in which a census was last taken. There is probably a certain connection between the introduction of the quinquennial census and another innovation, the omission of an enquiry that had been introduced into a former census. The enquiry as to duration of existing marriages and the number of children born of such marriages prescribed in 1911 has been omitted in 1921. It may be thought sufficient to ask this question every ten years, thus making room for other pressing questions to be asked from time to time.

The new arrangements can better be studied after the publication of the "General Report." Meanwhile some leading facts stated in the Preliminary Report may be noticed. The birth-rate in the period 1915-18 was lower by some 20 to 25 per cent than what normally might have been expected. The increase of population in England and Wales was less in absolute number than the increase in any other intercensal period since 1811. The increase per cent of the population was very much less than ever before. Besides the diminution of births—more than a million fewer than during the period 1901-1911—there was an immense increase in the category "loss due to excess of outward over inward migration." For the number of the outward bound was swollen by the deaths of non-civilians belonging to England and Wales which occurred outside the United Kingdom. These "unreturned brave" numbered about 560,000. The loss of so many men has aggravated the disproportion between the sexes. Whereas the excess of females was in 1911 in round numbers 1,180,000, it was in 1921 1,720,000. The ratio of females to 1000 males which was in 1911 1008 had become 1095 in 1921. There is some contrast in respect of these features between the country as a whole and the several subdivisions. The census of Scotland and that of Ireland will no doubt also present contrasts.

[See Bowley, "Births and Population in Great Britain," *Economic Journal*, June 1924.]

F. Y. E.

CENSUS OF PRODUCTION. During the nineteenth century the census in this country was confined to a decennial enumeration of the population, and did not attempt such comprehensive collections of industrial statistics as were regularly included in the census of the United States and our principal overseas dominions. In 1906 the Census of Production Act empowered the Board of Trade to make a census of production. The statistics of agriculture and of mining annually published by

the Board of Agriculture and the Home Office were deemed to be sufficient, and these industries were excluded from the operation of the Act. In 1908 a census relating to 1907 was taken, and in 1911 the repetition of the enquiry was authorised for each succeeding fifth year. Material was gathered for 1912, but before this could be completely examined and checked the outbreak of war caused the work to be abandoned, and the results have been considered too imperfect for publication. The Census of Production Act, 1917, provides that "it shall not be necessary to have a fixed interval between any census of production under the principal Act and another such census, and such a census shall be taken in any year which is fixed for the purpose by an order made by the Board of Trade and laid before Parliament; and, if the order so directs, may be limited to any trades or businesses mentioned in the order—provided that there is at least a year's interval between the date on which the order is made by the Board of Trade and the commencement of the year in which the census is to be taken." Preparations were made for a census for 1920, but on grounds of economy the enquiry was countermanded. It was announced that a census relating to 1922 was to be taken, but this enquiry was abandoned at an early stage, and it was ultimately decided to take a census relating to 1924.

The difficulty of ensuring an accurate Census of Production is very great. The reluctance of producers and traders to give full and clear information as to their businesses has to be surmounted, and the utmost vigilance is needed to avoid counting over and over again the value of the constituent portions of many productions. For example, in textile manufactures, if the spinning and weaving industries are separated, the yarn is counted twice; if the wool is produced in the same country, and the census include agriculture, it is valued three times. For these difficulties see the article by Mr. G. Udny Yule in the *Journal of the Royal Statistical Society* for March 1907.

As to the Census of Production in other countries, see A. W. Flux, *Journal of the Royal Statistical Society*, May 1924. H. H.

CERNUSCHI, Henri (1821-1896), born at Milan, is principally known by his writings on finance, and as a strong adherent of bimetallism, holding that the ratio should stand unalterably at $15\frac{1}{2}$, notwithstanding variations in the market price of silver. He is regarded as the originator of the term "Bimetallism." He was educated for the legal profession, but his studies were interrupted by the revolutionary movement of 1848, in which he took part. He sat in the National Assembly at Rome in 1849-50, till the revolutionary government fell, when he escaped to Paris. There, naturalized as a French subject, he made a considerable fortune in banking, and took a strong interest in politics. He opposed the Socialist movement, and especially the *plebiscite* of 1870, spending large sums of money in doing this, as well as in putting into practice his theories of co-operation.

He wrote: *Mécanique de l'échange*, 1865.—*Illusion des Sociétés Co-opératives*, 1866.—*Or et argent*, 1874.—*La Monnaie bimétallique*, 1876.—*Le Bimétallisme en Angleterre*, 1879.—*Le Bimétallisme à quinze et demi nécessaire*, 1881.—*Le Grand Procès de l'Union Latine*, 1884.

CHILDREN'S EMPLOYMENT. In this country children (who, for our purpose, are defined as persons under fourteen years of age) have for many years (see Children's Labour) been engaged in a large number of occupations outside the home. As the public conscience grew in regard to responsibility for the welfare of children, the community took more and more power to itself to regulate their employment; and there are now very few cases in which the State or the municipality cannot or does not make regulations for the good of the child.

Forms of employment are:

Industrial Employment. The half-time system of employment in factories and workshops remained on the statute-book from 1833 till 1920. Those who condemn the system should not forget that the half-time clauses in the various Factory Acts constituted, in fact, the only effective system of compulsory education existing before 1870. With the coming of universal compulsory education, however, the system ceased to operate beneficially; gradually many local authorities made bye-laws (under the Education Acts) directed against it, and an Inter-Departmental Committee reported in 1909 in favour of its abolition by law. Even before this the system was practically confined to the textile districts of Lancashire and Yorkshire, but public opinion in these areas favoured its continuance. It was not until after the war that this public opinion was found to have melted away; that it had done so was shown by the fact that the coming into force of the Employment of Women, Young Persons and Children Act, 1920, which abolished the system, was attended by very little friction. This Act was passed to give effect to the Draft Convention adopted by the first Conference of the International Labour Organisation of the League of Nations, held at Washington in 1919. It prohibited the employment of any child under the age of fourteen years in any "industrial undertaking," the definition of which covers (as in the Draft Convention) factories, workshops, mines and quarries, together with constructional work, and rail or road transport. The Act had the immediate effect of

raising the minimum age at which children might be industrially employed. In factories and workshops, not only did it abolish the half-time system, but it swept away all possibility of full-time employment at thirteen years, hitherto legal, under certain circumstances, for children who had gained specified educational certificates. It had a similar effect on the employment of boys of thirteen years in mines and quarries, which up to this date had been governed by the Mines Acts alone. Before leaving industrial employment, mention must be made of the Employment of Children Act, 1903. This Act contained certain general restrictions operative in industrial as well as other employments, and its clauses included regulations as to the carrying of heavy weights, and prohibition of employment in any occupation likely to be injurious to life, limb, health, or education. This Act was repealed by the Education Act, 1921, which, however, re-enacted all its provisions.

Employment in and on the Business of Shops. Children's employment is not specially dealt with in the Shops' Acts, 1912-13, the weekly limit of hours in and about a shop, for all young persons under eighteen years, being seventy-four hours weekly, including meal times. Children's hours are, however, governed by the Education Act, 1921 (superseding the Employment of Children Act, 1903), which lays down certain regulations in regard to employment generally. Moreover, local education authorities are given power to make more stringent rules (including prohibition of employment) by bye-law, with respect to all occupations or to any specified occupation other than industrial. Thus work in or about shops, newspaper or milk delivering, and the running of errands generally, can be regulated according to the circumstances of the locality and the zeal of the local education authority. An increasing number of authorities are adopting such bye-laws, which are required to be framed on certain lines and to be confirmed by the Home Secretary.

Street Trading. This was defined by the Employment of Children Act, 1903, to include the hawking of newspapers, matches, flowers and other articles, playing, singing or performing for profit, shoeblacking or any other like occupation carried on in streets or public places. This Act was the first to regulate street trading; it laid down a minimum age of 11 years below which no child might be employed, and it gave power to local authorities to make bye-laws with respect to street traders between that age and 16 years. The Education Act, 1921, raised the minimum age to 14 years and confirmed the power of the local authorities to make bye-laws in the case of persons between 14 and 16 years.

Employment in Public Entertainments. The legislation on this subject is now contained in the Education Act, 1921. It enacts (1) that no child under 12 years may be employed on the stage; (2) that children between 12 and 14 years may be so employed without a licence up to 8 P.M., or such time as may be fixed by bye-law; (3) that children between 12 and 14 years may be so employed up to any hour, if they hold a licence from a local education authority. Such licences can only be issued if the authority is satisfied that proper provision has been made to secure the health and kind treatment of the child, and are subject to conditions laid down by the Board of Education. Exemption from these regulations is allowed under certain circumstances in the case of charitable entertainments not held on licensed premises. Laws also exist to deal with the employment of children in dangerous performances, *e.g.* as acrobats and circus performers. In addition to earlier Acts, the Education Act, 1921, governs both employment and training.

Legislation abroad on the employment of children has been stimulated by the International Labour Conferences; ten States (including Belgium, Denmark, and Switzerland) have ratified the Draft Convention in regard to industrial employment, and thirteen more have recommended ratification. An important step towards the further regulation of child labour in the U.S.A. is represented by the Child Labour Amendment to the Constitution recently adopted by the Senate. Should the necessary number of States ratify the amendment in their several legislatures, Congress will have power to limit, regulate, and prohibit the labour of persons under 18 years, a power which at present belongs only to individual States.

H. C. E.

CLAMAGERAN, JEAN JULES (1827-1904). Although born in New Orleans, he was in 1850 admitted as a member of the Parisian bar, and later on made himself known as an opponent of the Imperial Government and an adherent of republican opinions. During the siege of Paris in 1870-1871 he superintended the service of public subsistence as *adjoint* (deputy) of the *Maire* of Paris. In 1879 he was appointed a councillor of state, and in 1882 he was elected a life senator.

Clamageran has largely contributed to periodical publications on questions of the day, both juridical, economical, and even religious (he was a Protestant). In 1873 he published a volume of constitutional, economic, and administrative essays under the title *La France républicaine*, and in 1874 another entitled *L'Algérie, impressions de voyage, avec une étude sur la Colonisation*, but his main claim to be remembered as an economist is his great history of taxation: *Histoire de l'impôt en France*, 3 vols., 1867-1868 and 1876. It is the only extant general work on the subject, beginning

with Roman Gaul, and ending at the accession of Lewis XVI. It is full of detailed and extensive information, and although no trained mediæval scholar, the author leads the reader safely through the maze of mediæval financial policy. His last volume, devoted to the last century of the *Ancien régime* (1683-1774), acknowledges the improvement of French finance since the death of Lewis XIV., but concludes that monarchy, fallen into disrepute by the vile reign of Lewis XV., had lost the moral power necessary to bring the task of reform to a satisfactory close.

Immediately after his death his widow collected and issued a volume of *Études politiques, économiques et financières* (1904), amongst which should be mentioned a Study on French finance from 1814 to 1889. E. Ca.

CLEARING HOUSE, THE LONDON BANKERS'.* Little is known of the early history of the London Bankers' Clearing House. Tradition says that the clearing system had its origin in the daily meeting in their luncheon hour of certain bankers' clerks at a chop house, probably the Five Bells in Dove Court, Lombard Street, between St. Mary Woolnoth and Smith's Bank, where the clerks used to lunch and exchange the cheques they had upon each other's firms.

The convenience of the system was evident, and the meeting in the public room was officially recognised by the joint renting by the bankers of a room in the chop house.

In 1773 we find entries in bankers' books: "To quarterly charge for use of the clearing room, 19s. 6d."

The next step, probably taken about 1784, was the renting of a larger room at Mrs. Irving's, next door to the Five Bells. Complaints being made that the room was too small, the first floor was taken out to make the light better and the room cooler.

In 1800 there were forty-three banks in the Clearing House, and some five years later a larger room was taken next to Messrs. Smith Paynes, and two inspectors were appointed, Mr. Thomas and Mr. White, the wine merchant of Lime Street.

In 1810 Mr. Thomas stated in his evidence before the Bullion Committee, that there were forty-six banks in the Clearing House, and that the average amount cleared was £4,700,000 daily, or on Stock Exchange settling days about £14,000,000, but it seems probable that the amounts quoted were for both sides, received and paid.

In early days the differences were paid by bank notes and gold, but later only notes of £50 and upwards were used, the balance in excess of the last £50 being carried forward to the next day's account. In 1839 the average amount of bank notes thus used was £213,100, the largest amount used in one day being £593,300, the smallest £108,000.

In 1829, when the house became too small and was rebuilt, there were thirty-nine banks clearing. By 1841 these had been reduced to twenty-nine. Until 1854 the private banks alone shared the control of the Clearing House, and refused with scorn the repeated applications for admission made by the joint-stock banks, which had come into existence after 1833, and were regarded as scarcely respectable by the private banks. By 1854, however, it had become obvious that the joint-stock banks had come to stay, and would, if perpetually repulsed from the Clearing House, start a Clearing House of their own, and in that year the following joint-stock banks were admitted, London and Westminster (founded 1834), London Joint-Stock Bank (1836), Union Bank of London (1839), London and County Bank (1839), Commercial Bank of London (1840), followed shortly afterwards by others, most of whom were admitted on amalgamation with a private clearing bank.

Another important change took place in this year 1854, for on 11th May the system of paying the balance due to or from the Clearing House in bank notes ceased, and the accounts have since been settled by cheque on the Bank of England, with which it is essential that each of the clearing banks should have an account. In 1858, as a countermove to the Country Bankers, who were proposing a separate Clearing, the Country Clearing was established on the lines of a scheme proposed by Mr. John Lubbock, afterwards Lord Avebury, with the result that country cheques, being henceforth easily collected, took the place of notes and bankers' drafts, and became part of the currency system of the country, thus effecting an enormous saving in the use of notes and coin.

In 1864 the Bank of England entered the Clearing House, to clear on one side only, the outside, for while the bank presents to the clearing bankers at the Clearing House all cheques payable by them, all cheques and bills drawn on the bank are presented by the clearing bankers direct to the bank. Owing to the amalgamations of recent years there are now (1924) only ten Clearing Banks besides the Bank of England.

The totals for the years of the paid clearing were:—

1839	£954,401,000
1868	3,425,185,000
1893	6,478,013,000
1903	10,119,825,000
1913	16,436,404,000
1923	36,627,592,000

Until 1901 the total for the year was given without subdivision into Town and Country, but in 1902 the Town and Country totals were separated, and in 1907 when the Metropolitan Clearing was established a third division was made. The figures given above for 1903 and onwards are divided between these three clearings as follows:—

	Town.	Proportion to Total.	Metropolitan.	Proportion to Total.	Country.	Proportion to Total.
1903	£9,234,956,000	91·2	..	..	£884,869,000	8·7
1913	14,191,275,000	86·3	£855,648,000	5·2	1,389,481,000	8·4
1923	32,270,373,000	88·1	1,546,565,000	4·2	2,810,654,000	7·6

The highest yearly total was reached in 1920, viz.: £39,018,903,000. Up to date, August 1924, the highest turnover for any one day was reached on 30th June 1924, when the huge total of £247,914,000 was recorded. The £200,000,000 mark was passed for the first time on 30th April 1924, and has been exceeded on nineteen separate days since.

The average daily totals for the three clearings for the above-mentioned years were as follows:—

	1883.	1893.	1903.	1913.	1923.
Town	..	..	30,081,300	46,225,600	105,115,200
Metropolitan . . .	..	..	..	2,787,100	5,037,600
Country	..	..	2,882,300	4,526,100	9,155,200
	19,314,600	21,170,000	32,963,600	53,538,800	119,308,000

The Town Clearing total through which the chief monetary transactions pass, such as the subscriptions for new issues, and the daily loans and repayments of the money markets, must not be relied upon as an indication of the course of trade. The Metropolitan and Country figures, reflecting as they do the trade of the Metropolis and of the Country, are a much better guide to trade activity.

For many years the returns used to be divided into four groups, Stock Exchange Settling Days, Consol Settling Days, Fourths of the Month and Ordinary Days, but such division has ceased to accord with the monetary conditions of to-day, for there are no longer Consol Settling Days, and the Bill payments which used to be concentrated by certain trades on the fourths of each month are now spread generally, so these divisions are no longer made.

The number of drafts passing through the Clearing House is enormous, and it is impossible to keep an exact record of their precise number but in 1922 a census was taken on two occasions, and the average daily number was computed to be 550,000, a figure which is constantly increasing. Indeed, did the old conditions, when the figures of all cheques had to be taken down by hand, still obtain, the present Clearing House would be far too small for the staff of clerks that would be necessary. However, mechanical ingenuity has solved the difficulty, and by the aid of the Burroughs machine cheques are not only listed, but the amounts totalled at one operation, and all errors, save those caused by taking down the amount of a cheque wrongly, are eliminated.

In comparing the above figures with those of other Clearing Houses, it must be remembered that the Bank of England clears only on one side. Did it clear on both sides, the annual amount would be very largely increased.

The Clearing House is situated in Post Office Court, Lombard Street, with frontages to King William Street and Abchurch Lane. Of the building itself little need be said. It has few architectural features of its own, except for its handsome oak-panelled Committee Room, for it has grown mainly by the absorption of premises built for other purposes; but additions have been made from time to time, and it is now vastly larger than it was even twenty-five years ago. Except for three inspectors, who are responsible for order and the carrying out of the rules, the Clearing House is staffed by each constituent bank sending from its own staff the requisite number of clerks for its own work.

Desks are placed round the walls and in the centre of the rooms, a certain number being allotted to each bank, according to its requirements. The banks are arranged more or less in alphabetical order, and sufficient space is left between the central and wall desks to enable the clerks to pass round the room and deliver their charges as the bundles of cheques are called. These charges are then taken to be listed to the rooms where the adding machines are located, the working of the Clearing House having been greatly changed by the use of the Burroughs adding machines. For the working of the Clearing House each bank has, in principle, though modified by the use of the Burroughs machine, two special sets of books ruled in columns, in which the cheques are entered under the head of each of the clearing banks. One set of these books, the out-clearing books, are written up at the office; the other, the in-clearing books, at the Clearing House. It must be remembered that "out"

and "in" clearing are only relative terms, and that what is sent to the Clearing House by Bank A as out-clearing, becomes when delivered to B at the Clearing House the latter's in-clearing.

The first step in the clearing is the sorting, in the office of each bank, of the cheques drawn on the other clearing banks under the names of those banks. Each parcel of cheques so sorted is entered by the out-clearer in his books at the bank under the head of the paying bank. If the list is a long one casts are made at intervals, and the total of these casts recorded as a check to accuracy on the back of the last cheque of each cast, which is turned over to draw the attention of the receiving clerk at the Clearing House to the cast, so that he can agree as he completes each cast. From the bank a clerk takes the charges to the Clearing House, and delivers them at the desk of each paying bank. The process is now repeated. The paying bank's in-clearing clerk takes down the charges in his books, or on the type-written rolls of the Burroughs adding and listing machines, taking care to see that the casts agree, and the cheques when taken down are sent to the office of the paying bank for payment or return.

At the close of the clearing each bank sends down its out-clearing books to the Clearing House, in order that they may be agreed with the in-clearing books of the banks there.

If the totals do not agree the books are compared and mistakes rectified. If the mistake is in the cast, the bank making the mistake corrects it; if the figures differ, the out-clearers alter their books to agree with the in-clearers; and should it ultimately prove that the mistake was the other way, the draft is produced and the difference claimed.

When the totals of the out- and in-clearing books are agreed, a sheet, having the printed list of the clearing banks in the centre, and a cash debtor or creditor column on either side, is drawn up by the head clearer of each bank, showing the balance due from or payable to each other bank; the two sides are then cast up, and the balance receivable or to be paid entered on a green ticket if the former, and a white if the latter. This ticket, which has to be signed by the inspector of the Clearing House, is an order to the Bank of England, either to transfer from the money at the credit of the account of the clearing bankers to the receiving bank's account, or from the money at the credit of the paying bank's account to the account of the clearing bankers, the amount of the balance, according as the balance is debtor or creditor.

As described above, the clearing will have taken place without any difficulties, but in practice certain other factors have to be reckoned with.

In the first place, every cheque that passes through the clearing cannot be paid by the banker it is drawn on; some have to be returned from lack of funds on the customer's account, or because the drawer has stopped the cheque, or because the endorsements are not in order, as well as for other reasons.

Such cheques, which must bear a written statement as to the reason for which payment is refused, on being returned to the Clearing House, are distributed so soon as the in-clearer has entered them on the debtor side of his sheet in the same way as the charges, and are included in the balance-sheet before the final balance is struck.

The day's work at the Clearing House now, 1924, commences with the *Metropolitan clearing*. This opens at 9 A.M. on ordinary days, and 8.45 A.M. on Saturdays, and closes at 10.30 A.M. on ordinary days, and 9.50 A.M. on Saturdays.

By the institution of this clearing the necessity for each bank to send out walk clerks to collect payment for cheques drawn on clearing bankers in the Metropolitan area has ceased. Each bank receives at the Clearing House all cheques drawn upon its Metropolitan branches, and forwards them direct to each branch, returns being sent back by post to the crossing banker the same day. There are now (1924) nearly 500 branch banks in this clearing.

All differences in the Metropolitan clearing are adjusted through the Town clearing.

The total of the "in" and "out" charges of the Metropolitan clearing is added to the amount of the Town clearing sheets.

In order to simplify the sorting of the cheques into the three clearings — Town, Country, and Metropolitan—the letters T, C, or M, as the case may be, are added at the bottom left-hand corner of the cheques.

Following on the Metropolitan clearing comes the Country clearing from 10.30 A.M. to 12.30 P.M., except on Saturdays, when the work begins at 10 A.M. and closes at 11.30 A.M. Owing to the fact that cheques in this clearing have to be forwarded to the country, and any returned cheques notified, it is impossible to adjust the balances the same day, or indeed until the next day but one, when they are entered on the Town clearing sheet.

Until 1902 the figures of the Country clearing were merged in those of the Town, but since that year they have been given separately.

The total for 1902 was £870,189,000, for 1913, £1,389,481,000, which had increased to £2,810,654,000 for 1923.

The Town clearing is held in two sessions, morning and afternoon, the morning beginning at 10.30 and the last delivery at 11 o'clock, after which the morning work is agreed. In the afternoon, work begins at 2.30 and the last delivery is at 3.30, when the doors are

shut and no more articles can be received that day. The "out" work having been brought to the House, agreement of the afternoon work takes place. All returns (unpaid drafts) must be delivered by 5 o'clock, and by 5.30 the day's work is done. On Stock Exchange settling days and other busy days the House is kept open a little longer with a corresponding extension for the last delivery of returns.

In addition to the London Clearing House there are now ten Provincial Clearing Houses at :—

Birmingham	£116,182,000
Bristol	57,760,000
Hull	55,695,000
Leeds	51,740,000
Leicester	37,419,000
Liverpool	450,325,000
Manchester	760,560,000
Newcastle-on-Tyne	103,846,000
Nottingham	31,440,000
Sheffield	57,688,000

which cleared in 1923 the amounts set against their names above. R. H. M.

COGNETTI DE MARTIIS, SALVATORE (1844-1891), born at Bari, died in Turin. When still a student of law at Pisa, the war of 1866 broke out. Cognetti marched with Garibaldi and was wounded at the battle of Condino. In 1868 he was appointed teacher of political economy in the Technical Institute of Mantua, and stayed there till 1878, when he obtained the chair of political economy at the University of Turin.

Cognetti considered economics as a branch of sociology. His mind was completely under the sway of Darwin (see DARWINISM and SPENCER). He also thought that economics was not in its proper place in the curriculum of faculties of law, as is the case at all Italian universities, unless taught so as to connect it with other branches of social science, history, ethnology, morals, law, politics, etc. The publication which gained for him his position at Turin was a book on *The Primitive Forms of Economic Evolution* (*Le forme primitive dell' evoluzione economica*), 1881, Loescher, Turin. In this book he discusses economic phenomena—and other social phenomena—among savage tribes and even among animals. His use of the latter illustration was often laughed at. But the book contains many interesting particulars, and became more appreciated in course of time. Among questions discussed therein, and later taken up again by Cognetti himself, I may mention the *origin of barter*, and consequently descriptions of *silent barter*. This topic was then a very novel one. In 1889 he published a book on *Ancient Socialism* (*Socialismo Antico*), Bocca, Turin, in which he traces socialism in ancient legends of Greece and Rome, of India and China, and gives summaries of doctrines of Chinese socialists, such as Mih Teih and Uang Ngan Shi, of Persians, such as Mazdac, and Hindus, such as Vishnu Das Kavi, besides going through all the Greeks. This book, again, was rather unusual, as coming from an economist, but had a better success than the former. It will be explained if I say that Cognetti was a passionate student of literature, and translated Plautus into very good Italian verses, and wrote historical essays. As an economist he wrote in 1891 an interesting book on *Socialism in the United States* (*Il Socialismo negli Stati Uniti*), Turin, a book which is eminently a history of the many socialist sects which have tried experiments in the States. He continued the *Biblioteca dell' Economista*, a collection of translations of foreign authors, which had been started by FERRARA. His prefaces, however, to the various authors whose works are translated, fall very far short from the excellency of those of Ferrara. When a discussion turned on what may be called economic niceties, he was soon out of his depth; very close reasoning was less agreeable to him than historical research. He wrote two more books, one in his true line: *On the Formation, Structure, and Life of Commerce*, and one on *Protectionism and Free Trade*, for which he was less fitted. Cognetti created at Turin a laboratory of political economy, collecting for it funds and a very large library. In this seminary of economic studies he trained some distinguished scholars. He had an extremely genial character, and his house was of an evening open to many friends. He was still full of vigour when he died. A complete bibliography of his writings is to be found in the *Riforma Sociale*, vol. xi p. 705. M. P.

COHN, GUSTAV (1846-1919), was born at Marienweder in West Prussia. He studied at the Universities of Berlin and Jena, and in 1869 obtained a post at the polytechnic at Riga, where he spent three years. After a visit to England in 1873 he published an important work on British railways *Untersuchungen über die englische Eisenbahnpolitik*, and ten years later issued another volume on the subject entitled *Die englische Eisenbahnpolitik der letzten* 10 *Jahre*. After his return from England he was appointed professor at the polytechnic at Zürich, where he remained until 1884, when he became professor of Political Economy at Göttingen. In 1892 he became a member of the Imperial Commission on the Stock Exchange, and as a result of his investigations published his *Beiträge zur deutschen Börsenreform*. As a supporter of the movement for the enfranchisement of women he wrote *Die deutsche Frauenbewegung: Eine Betrachtung über deren Entwickelung und Ziele* (Berlin, 1896). From the time of his visit to England he always maintained an active interest in English economic life.

Cohn published—*Untersuchungen über die englische Eisenbahnpolitik* (Leipzig, 1874-5); *Volkswirtschaftliche Aufsätze* (Stuttgart, 1882); *Die englische Eisenbahnpolitik der letzten* 10 *Jahre* (Leipzig, 1883); *Beiträge zur deutschen Börsenreform* (Leipzig, 1895); *Zur Geschichte und Politik des Verkehrswesens* (Stuttgart, 1900). His most important work, however, is his *System der Nationalökonomie*, published in three volumes (1885, 1889, and 1898) at Stuttgart. He also wrote several articles,

including an article in the *Economic Journal* for 1907 on *Government and Laissez-Faire*. His *System der Finanzwissenschaft* (the second volume of his *System der Nationalökonomie*) was translated in 1895 by T. B. Veblen and published under the title *The Science of Finance*, under the auspices of the University of Chicago.

Professor Cohn served as German correspondent of the Royal Economic Society from its foundation in 1890 until the outbreak of the War. E. L. H.

COLONIAL POLICY—RECENT DEVELOPMENTS.—This article does nor purpose to give a history of the growth of self-government in the British Colonies, a good account of which will be found in Professor Egerton's *Short History of British Colonial Policy*. Neither does it deal with the basis and limits of colonial self-government from the point of view of constitutional theory. For that aspect of the case the reader may be referred to Professor A. V. Dicey's admirable work on *The Law and the Constitution*. The present inquiry is neither historical nor technical nor legal. It is an attempt to examine the relations at present existing between the self-governing Colonies and the United Kingdom, and between these Colonies *inter se* from a purely political and practical point of view.

The inquiry is confined to the Colonies which are commonly described as having "complete self-government" or "responsible government," *i.e.* an Executive responsible to a popularly elected Legislature, and requiring a majority in at least one of the chambers of that Legislature in order to remain in power. This system, which is a reproduction *mutatis mutandis* of the existing unwritten, but none the less unquestioned, constitution of the United Kingdom, prevails in all the larger and more populous Colonies of the Empire mainly inhabited by people of European race. These are the Dominion of Canada, the Commonwealth of Australia, the Dominion of New Zealand, Newfoundland, and the Union of South Africa.

Enormously as these communities differ *inter se* in size, wealth, and population, they are all equals in constitutional status, and they are all intensely jealous of their right to manage their own affairs without interference from the United Kingdom or from one another. So strong has this feeling grown that even the term "Colony" is now objected to, as implying some degree of dependence, and it would, no doubt, conduce to a good understanding if we could all agree to abstain from describing these communities as "Colonies," and call them by some more dignified and appropriate title, such as "States of the Empire."

But this designation at once brings us face to face with the anomalous character of this so-called "Empire," which, as a political entity, has no analogy in history. It is, indeed, far less misleading to describe Canada, Australia, and the other self-governing communities above referred to as "States," than to describe them and the United Kingdom collectively as an "Empire." The United Kingdom and its dependencies, such as India, our various "Protectorates," and the Colonies which are not completely self-governing, may indeed be described as an "Empire" in the ordinary sense of the word. But when we extend the term "British Empire" to include the self-governing States, it is necessary to remember that we are stretching language, and using the word "Empire" in a novel and, etymologically, indefensible sense.

But this abuse of language is justified by practical considerations. It serves to indicate the continued existence of a political bond between the genuine Empire and the self-governing States, which is not the less real because it is exceedingly difficult to analyse and define. And it is worthy of note that the self-governing States are, as a rule, no less jealous of their claim to be regarded as members of the Empire than they are jealous of their "independence" of the United Kingdom and of one another. The word "Empire" is as popular with the people of these States as the word "Colony" is unpopular, and this fact is of immense significance. It testifies to an underlying sense of unity, an enduring desire to remain, in some way or other, though the way is seldom formulated or clearly thought out, members of a single body politic distinct from the rest of the world.

The problem of the future, as far as the British Empire is concerned, is how to satisfy that desire without curtailing the autonomy or hampering the individual growth of a number of self-governing States. Independence on the one side, Imperial unity on the other—are these irreconcilable ideals? Undoubtedly they are if we push the idea of independence too far. There is no binding relationship, however voluntary, no alliance, no partnership, no contract even, which leaves the parties to it absolutely independent of one another. Every form of union implies some limitation to freedom of action on the part of its individual members. But then it is not independence in the sense of the absence of any binding relationship with other parts of the Empire, which the people of the self-governing "Colonies," or at least the majority of them, really desire. They are determined to be independent in the management of their local affairs. And even with regard to affairs not purely local, they have a growing dislike of subordination to any external authority except that of the Crown. But it does not follow that they would not fall in with, and indeed welcome, any arrangement for the management of affairs not purely local,

even though it limited their freedom of action, provided that it was based on the principle of co-ordination, not of subordination. It is perfectly evident that any common institutions, and even any common action, embracing the self-governing Colonies and the rest of the Empire, must start with the idea of partnership, of the voluntary combination of a number of units, equal in status, though no doubt greatly varying in strength, and not with any idea of tutelage or dependence.

The very fact, already referred to, that the self-governing Colonies accept, and even glory in the authority of the Crown, is sufficient evidence that they do not desire independence in the sense of absolutely separate existence. It may be said that they accept that authority only because it is nothing more than nominal; and there is some truth in this argument, but it is not the whole truth. That strong loyalty to the sovereign, which is undoubtedly felt in the self-governing Colonies, is due to something more than gratitude for non-interference. It is due to a feeling of pride in the Crown as an august institution, common to the whole Empire, in which they have just as much lot and part as the people of the United Kingdom. The traditional relationship between the King and his subjects is just the same relationship, whether these subjects are born and reside in Canada, or Australia, or in Great Britain. He is their sovereign, just as much as he is the sovereign of the people of these islands. This is not mere theory. It is the actual sentiment of the people of the self-governing States, and in such a matter sentiment is everything. Wholly different is the Colonial attitude towards every other institution of the "Mother Country," not excepting the British Parliament. That body enjoys and always will enjoy a certain prestige with the younger States of the Empire as being the progenitor and archetype of their own Parliaments, but though they may regard it with respect, they do not feel that they owe it any allegiance. It is in no sense theirs as the Crown is. It does not represent them, but only the people of the United Kingdom. And still less do they feel disposed to bow to the authority of the British Ministry of the day, deriving its power, as it does, solely from the British Parliament in which the Colonies are not represented.

Here then is the problem in a nutshell. The self-governing Colonies, speaking broadly, are "loyal to the Empire." They desire to remain in some sort of political union with the United Kingdom and its dependencies, and with one another. They gladly recognise the authority of the King as the head of that union. But, according to constitutional theory and practice, "the King reigns, but does not govern." And there is no *governing* power, no actual executive authority, under the King, which commands the complete allegiance of the self-governing Colonies, because there is no such authority in the constitution of which they have any share —no common Parliament, no common Minister.

No doubt in theory the Parliament of the United Kingdom is supreme throughout the Empire. It could legislate for the self-governing Colonies as well as for any other part of the dominions of the Crown. But in practice it no longer does so, except at the request of these Colonies themselves, because it recognises its non-representative character as far as they are concerned. The British Ministry, on the other hand, does from time to time take executive action affecting even the self-governing Colonies, as in the case of treaties and negotiations with Foreign Powers, and that action may be not only independent of, but actually contrary to the desires of the Colony or Colonies concerned. In a case concerning the Newfoundland fisheries (1906) the action of the British Government was contrary to the wishes of Newfoundland; in a decision connected with the New Hebrides (also 1906) it was contrary to the views of Australia and New Zealand.

Such incidents are clearly injurious to good relations between the mother-country and the Colonies, and even fraught with danger to the unity of the Empire. Yet under present conditions it may be difficult to prevent their recurrence. They are not due to any want of good-will on the part of British Ministers, but to a difficulty inherent in the loose political organisation of the "Empire." There must be some authority capable of representing the Empire as a whole in dealing with Foreign Powers. As matters stand, the only possible authority is the British Foreign Office, which is a branch of an executive Government in which the Colonies have no part. The practical justification for that government, the government of the United Kingdom, acting on behalf of the Colonies, which it does not truly represent, as well as of the United Kingdom which it does represent, must be sought in the fact that the burden of the defence of the Empire rests almost wholly on the people of the United Kingdom. It is they who would have to bear the brunt of any difference with Foreign Powers, even if it arose over some question directly affecting only one or more of the self-governing Colonies, and in which the United Kingdom itself had only an indirect interest. There is thus a genuine and permanent dilemma. It is only natural that that part of the Empire which is responsible for the safety of the whole should control the relations of the Empire with Foreign Powers. Yet it can never be satisfactory that the United Kingdom should take action affecting the other "self-governing" States without their consent. In so far as it does that, it treats them, not as partner States, but as dependencies, and that, as we

have seen, is a position to which they are no longer inclined to submit, and to which, having regard to their growing strength and importance in the world, it is not reasonable or desirable that they should submit.

The only logical solution lies in a federal system, under which the "self-governing" States would share, to the extent of their ability, the burden of the common defence, and would receive in return a proportional share in the control of policy. But the adoption of anything like a complete federal system is beset with difficulties, which are certainly at present, and may be at all times, insuperable. On the other hand, the pressure of circumstances will certainly necessitate the introduction of make-shift arrangements having a federal tendency. And it is possible that the ultimate result may be the creation of a network of special arrangements between the mother-country and the self-governing Colonies, and between these Colonies *inter se*, providing for the co-operative regulation of various common interests. The alternative is complete separation, to which, however, as we have seen, the sentiment of the majority of the people in all parts of the Empire is opposed.

Recent history, no doubt, contains evidence of a movement in both directions—a movement towards separation, and a movement towards closer union, and there is room for difference of opinion as to which is the stronger of the two. On the one hand, the dissatisfaction felt in the Colonies with the manner in which their external relations have been handled by the Imperial Government has led (notably in Canada after the unpopular settlement of the Alaska Boundary question) to a demand for "the treaty-making power." Great latitude is already enjoyed by the Colonies in dealing with the commercial relations between themselves and Foreign States. But if this tendency were to be carried to the length of giving to each self-governing Colony the right to make treaties with Foreign Powers irrespective of the United Kingdom and of the other self-governing Colonies, it is difficult to see how their position could be differentiated from that of a number of wholly separate States. On the other hand, recent years have witnessed not only a remarkable increase in the sentiment of relationship and community of interest, but a series of attempts, so far not very successful, yet persistently renewed, to provide some means for enabling the governments of the United Kingdom and of the self-governing Colonies to act together in matters of common concern. The most important of these have been the meetings in 1887, 1897, 1902, 1907, and 1911, of the body formerly known as the "Colonial" and now as the "Imperial" Conference. These meetings, at first occasional and informal, have now, by virtue of a resolution unanimously adopted at the meeting held in London in April and May 1907, acquired a more definite and permanent character, and the "Imperial Conference" may therefore be regarded as having become part of the institutions of the Empire. It is, in fact, the only live political institution common to the United Kingdom and the self-governing Colonies, with the exception of the Crown. Its nature and functions were defined by the resolution just mentioned, which, in view of the importance of the matter, it may be desirable to quote in full. The resolution runs as follows:—

"*That it will be to the advantage of the Empire if a Conference, to be called the Imperial Conference, is held every four years, at which questions of common interest may be discussed and considered as between His Majesty's Government and His Governments of the self-governing Dominions beyond the seas. The Prime Minister of the United Kingdom will be* ex officio *President, and the Prime Ministers of the self-governing Dominions* ex officio *members of the Conference.*

"*The Secretary of State for the Colonies will be an* ex officio *member of the Conference, and will take the chair in the absence of the President. He will arrange for such Imperial Conferences after communication with the Prime Ministers of the respective Dominions.*

"*Such other Ministers as the respective Governments may appoint will also be members of the Conference—it being understood that, except by special permission of the Conference, each discussion will be conducted by not more than two representatives from each Government, and that each Government will have only one vote.*

"*That it is desirable to establish a system by which the several Governments will be kept informed during the periods between the Conferences in regard to matters which have been or may be subjects for discussion, by means of a permanent secretarial staff, charged, under the direction of the Secretary of State for the Colonies, with the duty of obtaining information for the use of the Conference, of attending to its resolutions, and of conducting correspondence on matters relating to its affairs.*

"*That upon matters of importance requiring consultation between two or more Governments which cannot be conveniently postponed until the next Conference, or involving subjects of a minor character, or such as call for detailed consideration, subsidiary Conferences should be held between representatives of the Governments concerned specially chosen for the purpose.*"

The importance of this curious resolution consists almost entirely in its implicit homage to the conception of the United Kingdom and the "self-governing dominions beyond the seas" as a potential confederation, and in any case standing to one another on some exceptionally intimate relation of a permanent kind. Apart from this its practical value is small. The

function of the Conference does not go beyond the "discussion" and "consideration" of "questions of common interest." Any decision it may arrive at will still require to be confirmed by each of the States individually before common action can result. And even as a purely consultative assembly the Conference is of very limited utility. "Questions of common interest" are growing in number and importance. They cannot be disposed of in a discussion limited to a few weeks every four years, nor can they be expected to be obliging enough only to crop up, or only to become acute, when such a meeting is impending. Clearly, if the consultation is to be serious, it must be entrusted to some body capable of more continuous activity. An "Imperial Council," not indeed constantly sitting, but capable of being summoned at any time as occasion requires, would appear to be indispensable, if the idea of the several Governments habitually taking counsel together on questions of common interest is to be realised in practice.

But for the establishment of such a Council, even though limited to purely consultative duties, the Conference of 1907 was not prepared. No doubt there was a forward party, consisting of the representatives of Australia, New Zealand, and Cape Colony, who would have been ready to go that length. But the Prime Ministers of Canada and of the Transvaal decisively hung back, and they were supported in that attitude by the representatives of the United Kingdom. And for so important a step as the creation of a common council, unanimity, or at least a great preponderance of favourable opinion, was evidently necessary. So, on the principle that "the pace of a squadron is the pace of its slowest ship," the Conference confined itself to the creation of what may be described as an Imperial Information Office, in the shape of a "Secretariat," the duties of which would seem to consist in keeping up some sort of touch between the members of the Conference in the years intervening between the sessions of that body. Such an office, energetically worked, would be capable of considerable development. And the forward party at the Conference were anxious to give it the maximum of influence and prestige by making it an institution common to the whole Empire, independent of any one Government, and responsible to the Conference alone. In the end the Secretariat was made a department of the Colonial Office. Its existence can only be regarded as a small concession to the principle of continuous common consultation between the several Governments. At the Conference for 1911 the creation of an Imperial House of Representatives, of a standing Committee to preserve the continuity of the Conference between its meetings, of an Imperial Council of Defence were discussed, as well as greater uniformity in Imperial legislation.

Generally speaking, it is the mass of the people in the different parts of the Empire who are most favourable, if not very deliberately or articulately, to the idea of closer union. It is in government and political circles that there is opposition or reluctance. And this is perfectly natural. The bulk of the people, where they are of British origin, are dimly conscious of the ties arising from community of race, history, and traditions, as well as of the advantages of a common citizenship, and it would appear to them unnatural to find themselves wholly separated from their fellow-Britons across the seas. Politicians, on the other hand, even when not playing up to the non-British elements, which in some of the Colonies form a large or even preponderant part of the population, are more alive to the practical difficulties which closer union presents. And they are not uninfluenced by the feeling that the independent Governments and Parliaments, to which they respectively belong, would suffer some diminution of individual importance by entering into a real Imperial partnership. Here and there statesmen of exceptional originality and largeness of mind may rise superior to considerations of that nature. But the average politician is certainly affected by them, alike in the Colonies and the United Kingdom. Indeed, it is especially in the United Kingdom that statesmen of the older school, whether Liberals or Conservatives, seem to find a difficulty in conceiving how the foreign policy of the country could be carried on, if it were complicated by the necessity of acting in conjunction with the self-governing Colonies. And yet it is certain that, as these communities grow in importance and play an increasing part in the world, we must "call them into our counsels," if they are not to develop foreign policies of their own and so to become in time wholly separate States, as British statesmen at one time, almost without exception, expected and desired that they ultimately should do. Nowadays such a desire is felt by few and avowed by none. But "he who wills the end must will the means." And if we seriously desire the United Kingdom and the self-governing Colonies to remain one body politic, it follows that, whatever its difficulties, the policy of deliberate co-operation in matters of common interest, of which the Imperial Conference and the proposed Secretariat are the first rudimentary expressions, must be steadily pursued, and pursued on lines which in the long-run will entirely transform the present constitution of the Empire.

But that transformation will be gradual, and it is impossible to forecast the exact course of it. Whatever the new institutions which may be evolved to meet the new needs, they are likely to be very different from anything which political theorists have yet imagined. It is only possible here to glance at one or two of

the common interests which may compel the creation of common institutions. Among projects tending to promote communication between different parts of the Empire there are none which find more general favour than an all-British steamship route and an all-British system of submarine cables. If either of these were established, it could only be by contributions from the several portions of the Empire directly interested ; and, indeed, it is probable that, either in the first instance, or ultimately, the ships and the cables would be the property of the contributing States. The administration of that property would require a Board on which all the owners must be represented. But the common property would not only have to be administered, it might need to be defended. It would only be logical that all the owners should combine to guarantee its protection from external interference. Another and an even more important case for co-operation is in future likely to arise in connection with the dependencies of the Empire. At present the dependencies, from the great dominion of India down to the smallest coaling station which is not situated in one of the self-governing Colonies, are under the exclusive control of the United Kingdom. But there are some of them in which certain of the self-governing Colonies are even now more directly interested than the United Kingdom is, and with regard to others the interest of the self-governing Colonies is certain to increase. Australia and New Zealand are bound to make themselves felt in respect of the British islands of the Pacific. Federated South Africa must certainly have something to say about the Protectorates beyond the Zambesi. But Great Britain is not likely to abdicate her authority in either quarter. The necessities of the case demand some arrangement by which the burden and responsibility will be shared between the mother-country and the self-governing Colonies immediately concerned. This will be furthered by the remarkable proof of loyalty shown in the liberal support recently given by the Colonies to the maintenance of the navy. The above are but a few instances of the way in which the growing complexity of Imperial relations will compel changes in the machinery of government.

In this brief review of the tendencies making for or against the closer union of the different portions of the Empire nothing has been said on the subject of Preferential Trade. In the opinion of many—and it is an opinion shared by the present writer—the adoption of preferential trade arrangements between Great Britain and the self-governing Colonies would be a powerful factor in promoting Imperial consolidation. Public opinion in the Colonies has been inclining more and more strongly towards this view. But the question is too large to be treated within the limits of the present article. [See TARIFF REFORM MOVEMENT.]

The object of the preceding observations has been to direct attention to other aspects of the situation, at present liable to be thrown into the shade by the concentration of public interest on the question of preference and the acuteness of the controversy with regard to it.

COLONIES: GOVERNMENT OF, BY COMPANIES.* Since the first edition of this dictionary the British South Africa Company has fulfilled its destiny by effecting the practical settlement of some of the best parts of Africa ; the colonists whose development it fostered have grown strong enough to claim the right to separate administrations, and the Colony of Southern Rhodesia, with its own responsible government, became on 1st October 1923 the latest addition to the series of self-governing British states. C. A. H.

COMMERCIAL INTELLIGENCE (UNITED KINGDOM). ORIGIN AND DEVELOPMENT.—To meet the desire expressed by the British commercial community for greater assistance by the Government in the development of their overseas trade, a committee was appointed by the Board of Trade, July 1897, to inquire into and report upon "the dissemination of commercial information

and the collection and exhibition of patterns and samples." The report was published in 1898 (Cd. 8962).

As a result of this report, the Commercial Intelligence Branch was opened, October 1899, at offices in Parliament Street. In April 1904, in order to be of greater advantage to business men, it was transferred to the city, to 73 Basinghall Street, E.C.2. Here information on all subjects of commercial interest was collected and focussed in a form convenient for reference. The offices of the branch contained an inquiry room where personal inquiries could be made on the subjects dealt with; a sample room for the exhibition of specimens of interest received from the Imperial Institute, India, and the Colonies, or illustrative of reports of H.M. Consuls, or of the correspondents or special commissioners of the Board of Trade; and a reading room, where the latest official publications—British, Colonial, and Foreign—and the latest issues of Trade Directories could be consulted.

Owing to the increasing use by business men of the facilities afforded, the scope of the branch was extended in various ways, particularly by the incorporation of the exhibition branch of the Board of Trade, and in 1917 it was raised to the status of a department of the Board of Trade.

As a consequence of the changed conditions brought about by the War of 1914-18, the department was further increased in 1918 by the addition of the War Trade Department of the Foreign Office.

The enlarged department thus created, known as the Department of Overseas Trade (Development and Intelligence), was placed under the joint control of the Foreign Office and the Board of Trade, and is represented in Parliament by a Parliamentary Secretary.

The head office is at 35 Old Queen Street, S.W.1, in close proximity to the Board of Trade. The city branch at 73 Basinghall Street, E.C.2, has been retained, and a Foreign Samples Exhibition and Library of Trade Catalogues has been opened at 7-11 Old Bailey, E.C.4.

Organisation at Headquarters.—The governing principle is that of co-operation between officers who have special knowledge of particular markets and officers having experience of particular industries. Accordingly, the department, so far as concerns the collection and distribution of commercial intelligence, falls into geographical and trade sections.

Each geographical section deals primarily with correspondence from its territory, and especially with the correspondence of the commercial, diplomatic, and consular officers, or the trade commissioners and trade correspondents in that territory.

Each trades section handles the correspondence with firms in this country in its particular trade, and is responsible for the distribution of commercial information relating to that trade.

An exhibition and fairs division has been formed to deal with the organisation of the British Industries Fairs and exhibitions of foreign samples and catalogues, and to study and initiate projects for commercial exhibitions of various kinds. A general division controls the reference library, where British and foreign trade papers are filed, and the sections of the office where information on tariffs, statistics, and transport is collated. An economic and editorial section deals with the preparation and editing of special and annual reports on economic and trade questions and banking matters.

Overseas Organisation.—The department is served by representatives throughout the world, who maintain a constant supply of information to the home centre and provide local assistance in the promotion of British trade. The department has control of the following services for this purpose:—

1. The Trade Commissioner and Imperial Trade Correspondent Services in the Empire.
2. The Commercial Diplomatic Service forming part of the British Diplomatic Missions in foreign countries.
3. The British Consular Service in foreign countries.

In the Empire there are now fourteen trade commissioners at work, covering Canada and Newfoundland (4), Australia (2), New Zealand (1), South Africa (2), India and Ceylon (3), East Africa (1), and the British West Indies (1), assisted by imperial trade correspondents at a few of the most important centres. The department also has the services of correspondents in parts of the Empire in which at present there is no trade commissioner.

In place of the handful of pre-War commercial attachés, a new service, styled the Commercial Diplomatic Service, has been established. The members of the Commercial Diplomatic Service are styled "commercial counsellors" in the highest grade and "commercial secretaries" in the three lower grades. There are twenty-eight of these officers who are stationed in all the more important foreign markets of the world. They are members of the staff of the British Embassy or Legation in which they serve, and rank with the diplomatic officers of corresponding grades, with whom they co-operate in matters political as well as commercial.

The Consular Service has been under control of the Department of Overseas Trade since October 1919. Consular officers report direct to the department, and are also, as regards the commercial side of their work, under the general supervision of the commercial diplomatic officer for the area in which their district lies. This arrangement ensures that special prominence is given to the commercial side of consular work, and by the co-operation of the two services a complete network of govern-

ment commercial representatives is thrown over foreign countries.

NATURE OF INTELLIGENCE COLLECTED.—The information collected by the department's overseas officers relates, *inter alia*, to :—

(*a*) Contracts open to tender ; (*b*) Overseas demand for particular goods ; (*c*) Lists of importers of various goods in overseas markets ; (*d*) Suitable agents for British manufacturers and merchants ; (*e*) Best methods of marketing and distribution, credit conditions, terms of payment, nature of competition and the best way of combating it. (*f*) Customs tariffs and regulations, regulations governing commercial travellers, registration of trade marks, consular invoices, etc. ; (*g*) Statistics of imports and exports ; (*h*) Shipping and transport ; (*i*) Manufacturers of any specified goods in the United Kingdom ; (*j*) Sources of supply of raw materials and of goods not manufactured in the United Kingdom.

HOW THE INFORMATION IS OBTAINED.—Every effort is made to maintain a constant supply of information from the overseas officers to the department, and to provide local assistance in the promotion of British trade. To secure this, overseas officers furnish answers to specific inquiries, either direct to applicants or through the Department of Overseas Trade. Overseas officers are also encouraged to conduct investigations on their own initiative. In addition, inquiries to be conducted by local officers on the spot are frequently initiated at headquarters ; while from time to time the department, in co-operation with important trade associations, despatches special missions to investigate the condition and prospects of trade in particular classes of industrial products in various overseas markets.

All the overseas officers of the department, including consular officers, have been instructed to forward without delay information of interest to British Commerce, using the telegraph if necessary.

METHOD OF DISTRIBUTING COMMERCIAL INFORMATION.—The information reaching the department through the channels indicated is distributed by one or other of the following methods :—

General (*non-confidential*) *Information.*—Answers to personal or written inquiries on specific subjects are communicated personally or by letter direct to the applicant. Information of general interest received in the ordinary course of business, and not as the result of special inquiry, is disseminated by circular letter to particular classes of traders, to Chambers of Commerce, etc., for the information of their members, by publication in the *Board of Trade Journal* or by notices to the Press.

A regular feature of many trade papers (apart from the official *Board of Trade Journal*) is a column of "Openings for British Trade Abroad." Publicity is also given in the most important papers to articles written with the object of supplying trustworthy information on, and fostering interest in, overseas markets. Information is supplied by the department to the Press for these purposes.

Other methods employed with regard to non-confidential information comprise the issue of annual reports dealing with the industrial, commercial, and economic conditions prevailing in overseas markets ; the organisation of trade fairs with the object of attracting important overseas buyers and bringing them into touch with the British producer ; and the organisation of exhibitions of foreign goods and catalogues for the guidance of British manufacturers who may be able to produce competitive articles.

Confidential Information.—Much information received is of a confidential nature, or is of such value that it should not be allowed to become available to foreign competitors. It is, therefore, undesirable to give it general publicity. For such cases there are two channels of distribution—the first known as the Special Register and the second as Form "K."

The "Special Register" Service.—The trader who can command a prompt supply of confidential information as to trading conditions and developments overseas, and as to specific openings for British trade, is in an especially favourable position for securing business. The Department of Overseas Trade helps in this respect through its "Special Register," on which firms should enrol if they desire to receive such confidential information. Registered firms are grouped and classified according both to the nature of the goods and the markets in which they are interested.

United Kingdom firms engaged in export trade supplying goods solely or mainly of United Kingdom production are eligible for admission to the Register on payment of a small annual fee, which may be made to include subscription for the weekly *Board of Trade Journal*.

Form "K."—Brief reports covering the main preliminary particulars which a firm in this country contemplating business with an importer abroad would wish to know are forwarded to the department by consular officers in foreign countries in the form known as Form "K." Particulars are given of the class of goods imported by the firm reported on by the Consul, the general nature of the firm's business, and the name of its agent in the United Kingdom, if any. The information is made available to traders through the medium of the Association of British Chambers of Commerce, the Federation of British Industries, and certain other trade associations. Firms interested should apply to their Chamber of Commerce or trade association.

VISITS OF OVERSEAS OFFICERS TO COMMERCIAL AND INDUSTRIAL CENTRES.—Arrangements have been concluded whereby Overseas

Officers of the department when on leave in this country make a tour of the principal industrial and commercial centres in order to place personally at the disposal of manufacturers and traders first-hand information as to the condition and prospects of British trade in the Dominion or foreign country, as the case may be, where they are stationed. On these occasions also they are empowered to undertake special investigations, within reasonable limits, for individual firms or traders.

Trade Fairs and Exhibitions.—A modern development of the department's activities has been the inauguration of a series of trade fairs, including the British Industries Fair. These afford manufacturers and traders unique opportunities of displaying their goods before the buyers of all nations.

Exhibition of Samples and Trade Catalogues.—An extensive collection of foreign-made goods which find a ready sale in overseas markets has been made, and is constantly being augmented. Endeavours are made to quote selling prices, extent of demand, etc. After preliminary exhibition at various industrial centres, *e.g.* Birmingham, these samples are later placed on permanent view at 7-11 Old Bailey, London, E.C.4. In the same building is housed a library of over 13,000 foreign catalogues. This is of special interest to British manufacturers as showing various methods of foreign advertising. An index to the library may be obtained on application to the department.

Co-operation with the Business Community.—In addition to sending its Overseas Officers on trade tours round the United Kingdom, members of the Home Staff are sent at regular intervals to home industrial centres to learn their requirements and conditions and to consult with traders on questions affecting the trade of their district.

An Advisory Committee of prominent business men, representing various classes of the business community, has been formed to advise the department in its work and to strengthen the links between the department and Chambers of Commerce, Trade Associations, and manufacturers and traders generally. T. G. G.

COMMERCIAL ROUTES.* Changes in commercial routes have resulted from some of the great inventions dating from the close of the eighteenth century, and the modes in which these changes have been brought about deserve consideration in some detail. The most important of these inventions was that by which steam power was applied to locomotion. This was first effected on a commercial scale on the water, but very soon after on land, and steam railways were in the end the chief means of changing the direction and the relative importance of trade routes. They first made it possible to fill the large ships by which the cheapest ocean carriage is effected with bulky goods collected from the interior of vast continents. Hence arose the concentration of such traffic on a comparatively small number of great ports in the areas of despatch and of reception of goods of that class. These ports naturally became the entrepôts for the collection and re-despatch of articles of greater value in proportion to their bulk, which thus came to share in the advantages of large scale transport. In the regions of origin of the bulky goods these ports are naturally situated at the points most convenient for their concentration on the seaboard, in the regions of reception at the points best situated for supplying the largest populations consuming these goods. In India, for example, the new ports of Bombay, Calcutta, Madras, and Karāchi, replaced the old ports of Cochin and Calicut, which had such renown in the days in which pepper and spices had such pride of place in world commerce. In the west the growing wealth of England made London the great entrepôt, all the more because it is so situated as to be connected by short and hence frequent sailings with several other great seaports on the continent.

In North America the trade routes need more consideration. Early in last century three great ports on the Atlantic side, New Orleans, Philadelphia, and New York, had been brought into existence through the traffic collected by the rivers on which they stand, the Mississippi, the Delaware, and the Hudson. Of the two Atlantic ports, Philadelphia was the more important and the more populous city in the first quarter of that century, but a change was made in favour of New York by the opening of the Erie Canal, which passes through the Mohawk valley between the Appalachian Mountains on the south and the Adirondacks on the north, and connects the navigation of the great lakes at Buffalo above the falls of Niagara with the navigation of the Hudson below the falls at Troy, 140 miles north of New York, thus bringing this port into much easier connection with the rapidly growing farming population behind the Appalachians. The supremacy of New York was confirmed and enhanced when railways followed the same route, the physical features here making this northerly deviation of the route to the west so obviously convenient that this route cannot be challenged by any other rail route. But there is another competitor for western traffic during the summer half-year in the St. Lawrence route, completed before 1830, to the head of Lake Huron by canals to avoid falls and rapids, and in 1855 to Lakes Superior and Michigan by the construction of the first of the short canals at the rapids of Sault Ste. Marie (the "Soo"). But this navigation does not allow of the establishment of a commercial route for sea-going ships. For such vessels Montreal still remains the terminus,

but the establishment of such a route is still looked upon by many on both sides of the British-American frontier as a desideratum, and schemes for the purpose are now actively discussed.

There are thus at present three competing summer routes for the carriage of western grain from the wheat-growing areas of North America to the sea-board, an all-rail route, or rail routes, by the lakes to Buffalo and then by the Erie Canal, and by water all the way to Montreal, where transhipment takes place.

Another competing route for the eastward carriage of the produce of north-western Canada has been strenuously advocated for many years. This is known as the Hudson Bay route, inasmuch as it would touch the north-west at some port, probably Port Nelson, on the south-west of Hudson Bay. If carried out it would have the great advantage of being much shorter for Western Europe than any other existing or proposed route, with a port of shipment several hundred miles nearer to the wheatfields than Montreal, which is 1424 miles from Winnipeg, and separated from that city mainly by a vast region of Archæan gneiss, doomed for the most part to perpetual sterility and hence capable of cultivating very little intermediate traffic. The success of the shorter route depends, however, on the possibility of navigating Hudson Straits for a sufficiently long season after the grain is ready for export, and at present prevailing opinion seems to be against the prospects of success.

But other competition for the carriage of the grain of the north-west to Europe as well as other destinations has arisen in the west, and since the opening of the Panama Canal, August 1914, has developed with great rapidity. The British Columbian ports of Vancouver and Prince Rupert both serve as outlets for that region, notwithstanding the considerable height of the passes that have to be crossed to reach them. Some wheat and flour destined for Eastern Asia passed by way of Vancouver in the early years of the present century, but the rapid growth in the shipment of grain from this port dates from about 1920, since which year great additions to the provision of elevators at the port for dealing with the grain trade have been made. The greater part of the shipments, however, are not for Eastern Asia, but for Europe by way of the Panama Canal. The whole of Alberta and the western portion of Saskatchewan are said to have definitely adopted Vancouver as their chief port for this trade, but in future an increasing proportion of this trade is likely to pass by way of Prince Rupert, which, among other advantages, has that of a lower pass (3712 feet as against 5344 feet), with easier gradients across the Rockies (maximum gradient on the Prince Rupert route, 0·5; on the Vancouver route, 2·2 per cent for east-bound, 1·2 for west-bound trains). Both ports also have other bulky products from their immediate neighbourhood, timber, canned fish, fruit, etc., to facilitate the filling of large ships passing through the Panama Canal, and, as compared with the eastern Canadian outlets, have the great advantage of being open all the year round.

In the Old World the Siberian railway, completed in 1904 by the building of the difficult section round the south end of Lake Baikal, has already been mentioned. Much tea, formerly carried by camel caravans across the Gobi desert to the twin towns of Maimachin, on the Chinese, and Kiakhta, on the Russian side of the frontier, was introduced into Russia in pre-War days by this route without displacing the caravan traffic altogether, together with furs, gold, and graphite from Eastern Siberia, but the principal new traffic developed by this railway before the War was that in butter, the import of which from this source into the United Kingdom had come to be one of the most important contributions to our supplies of that commodity. Though the railway passes through regions as well adapted for wheat-growing as the Canadian North-West, the carriage of wheat westwards never attained great magnitude, owing to the great length of railway haulage involved in reaching the important markets and the small value of the article in proportion to its bulk even as compared with butter.

In Africa railways, unfortunately on different gauges, have penetrated far into the interior from the north (Egypt), east, and south. Of these the Uganda railway, ascending in the Kenya Colony to altitudes above 7000 feet, where the climate is suitable to Europeans at least as directors of plantations cultivated by natives, and terminating in a region producing increasing supplies of coffee, raw cotton, and other tropical products, is particularly important. The "Cape to Cairo railway" has reached Bukama, the head of easy navigation on the Lualaba, one of the head-streams of the Congo, a little south of 9° S., but there seems little prospect of this grandiose design being accomplished in the near future.

In Europe we meet with some interesting illustrations of combinations of sea and rail routes different from those chiefly referred to already, but naturally arising from the peninsular structure of the greater part of the continent and the importance of some of the European islands. The avoidance of the great roundabout connecting the seas on the north and south side of this peninsula was obviously desirable for passenger and for much goods traffic. Unfortunately there is only one route throughout the whole length of the peninsula from east to west not barred more or less by mountains, the route offered by the Rhine and lower Rhone valleys. This is clearly insufficient. Brief reference has already been made to the Trans-Alpine railways. Increasing engineering

skill has allowed of the establishment of easier connections between the opposite sides, even where the obstructions were most formidable, and it is worth noting that the tunnels successively pierced, down to the opening of the Simplon in 1906, are nearer and nearer base levels, at lower altitudes, and consequently longer but with easier gradients in the approaches.

That the railway connections through the Balkan Peninsula, where the engineering difficulties are less than in the Alps, should have come at a later date than most of the great Alpine tunnels is not surprising in view of the smaller commercial importance of this part of Europe, even including the peninsula of Asia Minor. The railway to Constantinople (1949 miles from Paris) by Belgrade and the valleys of the Servian Morava, the Nishava, and the Maritsa, and that to Salonica (1726 miles from Paris) by the upper Morava and Vardar valleys, both came seventeen years after the opening of the Mont Cenis and six years after that of the St. Gothard tunnel in 1888. The passes crossed on either route are only about 2500 feet high.

The railway to Constantinople is continued from Haidar Pasha on the opposite side of the straits by another railway on the same gauge to Konia, whence it is continued by the Baghdad railway, also on the same gauge, through Northern Syria to Nisibin (after bridging the Euphrates at the pre-historic crossing-place of Jerablus), with branches to Alexandretta and Damascus by Aleppo. But at Nisibin begins a break between this system and the narrow gauge railways of lower Mesopotamia (Iraq).

All the main railways of Europe except those of the Iberian Peninsula, pre-War Russia and Greece, are on the same gauge, 4 feet $8\frac{1}{2}$ inches, the gauge first fixed on the early railways of the Newcastle district, and afterwards adopted on all the main railways of North America. There are also lines on the prevailing European gauge from both Berlin and Vienna to Warsaw.

A peculiar association of rail and water traffic is that formed by train-ferries—vessels with rails on their decks to carry whole trains across intervals of water. Vessels of this kind plied across the Firth of Forth between Granton and Burntisland from about the middle of last century until the construction of the Forth Bridge. Now such ferries have for some years connected Jutland with the Danish islands of Funen and Seeland, and this island at Copenhagen with the mainland of Sweden at Malmö, and longer ferries connect Prussia with Sweden both by way of Denmark (Warnemünde to Gjedser in the south of Seeland) and direct (Sassnitz on the island of Rügen to Trelleborg in the south of Sweden).

During the War several train-ferry routes were in operation between England (Richborough and Southampton) and the continent. In 1921 the Richborough-Calais route was reinstalled as a private undertaking, and in 1924 another route of the kind was opened between Harwich and Zeebrugge.

Comparatively few inland waterways are of great importance as trade routes or part of trade routes. Delusive expectations are very widely entertained as to the importance of this means of transport. These are based on the unquestioned fact of the relative cheapness of mere haulage or propulsion on the water as compared with any mode of land carriage. Yet the facts that should dispel such delusions and enable one to estimate the conditions in which inland water transport is likely to be really economical are simple. Water carriage is likely to be advantageous in proportion to the extent to which the mere cost of haulage or propulsion enters into the total costs of transport, including loss of time and the number and cost of handlings between the place of origin and the destination of the goods. The importance of the latter consideration is well illustrated by the establishment of train-ferries for the express purpose of avoiding break of bulk. The enlarged Erie Canal, adapted to vessels of 1000 tons, opened for traffic in 1918, has never, down to 1923 inclusive, carried one-tenth of its full capacity.

Incidental reference has already been made to changes in ocean traffic due to the opening of the Panama Canal. This is the engineering work that has had most influence on ocean routes since the opening of the Suez Canal in 1869, but it cannot effect changes of such magnitude as those due to the earlier great ocean canal. It greatly shortens indeed the routes between most points on the west coast of America and both sides of the Atlantic Ocean, as well as those between most points of the east side of America and the western parts of the Pacific, but for the principal ports on the Atlantic sea-board of the United States the shortening of the route is appreciable only for the extreme east of Asia—the Japanese Islands and the Philippines and the ports of China from Shanghai northwards; and it is doubtful whether the shortening to Shanghai is sufficient to counterbalance the advantages of the Mediterranean route for this port. For traffic with Great Britain the new canal shortens considerably the route to New Zealand but not to Australia. In addition to the bulky cargoes already mentioned from the western ports of North America, the Panama Canal has proved to be more important for the carriage of Chilean nitrates to eastern North America and Europe than was anticipated. Probably the great increase in transport costs since the War has made the advantage of reduced mileage sufficiently great to make the change from sailing vessels round Cape Horn to steamers through the canal remunerative.

The great difference on ocean routes due to

the early inventions referred to at the beginning of this article lies in the independence of winds enjoyed by steamers. These are thus enabled to choose the shortest route between two ports when the outline of the coasts and other physical conditions allow of it and other considerations do not render some deviation from the great circle route preferable. The shortest route between any two points on a globe is a great circle, that is, a circle which has for its centre the centre of the globe. All meridians are thus parts of great circles, and all north-south routes are the shortest possible. But it is otherwise with east-west routes. The only east-west route that forms part of a great circle is one on the equator. The farther one goes from the equator the more does the great circle deviate from the parallel, in the northern hemisphere towards the north, in the southern towards the south. It is in the Pacific Ocean that physical conditions offer the greatest freedom in following great circle routes. From San Francisco the great circle route to Yokohama, which lies in a latitude about two degrees farther south, carries one northwards nearly to the Aleutian Isles—to a latitude more than ten degrees farther north than the port of embarkation. From Vancouver the route is still more northerly and shorter. In sailing thence to Yokohama one is out of sight of land only for two or three days. Shortly after the last of the Aleutian Isles is left behind the first of the Kuriles is picked up. Still shorter is the route from Prince Rupert, which is passed on the great circle route from Vancouver. This fact will no doubt also tend to stimulate the development of the Canadian grain trade to the Orient by that route.

In the geography of the Atlantic Ocean it is an important feature that all the ports of the United States south of Cape Hatteras are approximately on the great circle route from the mouth of the Gulf of Mexico to the entrance to the English Channel, and that most of the ports of Brazil are approximately on the great circle route from the north-west of Africa (the Cape Verde Islands) to Buenos Aires. In the north-west of the Atlantic, south of Nova Scotia and Newfoundland, the routes of steamers from the eastern ports of the United States to north-western Europe are modified in accordance with the average range of floating ice at different periods of the year, and the Hydrographic Office of the United States recommends for east-bound vessels a great circle route, beginning somewhere about 47° W. and between 39½° and 41½° N., according to the time of year, and for west-bound vessels, one ending about one degree north of the beginning of the east-bound route. In the Southern Ocean the adoption of great circle routes, say from Cape Town to Australia or New Zealand to Cape Horn, is precluded by ice.

But the routes of steamers are also largely governed by other conditions. Most important is the nature of the bulky cargo obtainable at different places. It is the business of the shipper to avoid, so far as possible, the necessity for sailing in ballast. For ships leaving Great Britain the chief bulky outward cargo is coal. Hence many shipping routes from this country are designed to get bulky cargoes of grain, timber, potatoes, fruit, and the like homeward with as little ballast sailing as can be managed. So too, since the development of the export of coal from Natal, another triangular route has become common. Vessels bringing cargoes by the Atlantic to Durban, carry coal thence to India, and other cargoes thence to Europe by the Suez Canal.

The United States has also, since the outbreak of the War, and more particularly since the opening of the Panama Canal, been carrying on an increasing export of coal, and as Norfolk and Newport News, at the mouth of Chesapeake Bay, the outlets for some of the best American steam coal, are not much off the great circle route from the mouth of the English Channel to the Panama Canal, they have become much frequented coaling stations.

Coaling stations generally are naturally established at points where important commercial routes converge, such as Teneriffe, Gibraltar, Malta, Port Said, Aden, Colombo, Singapore, and Hong-Kong, and, since the development of the Natal coalfields, Durban, whose harbour, in order to meet the requirements of that trade, has been greatly improved. Such stations are, for the same reason, convenient for the development of great entrepôt trade, even though they may have little or no trade of any other kind.

The invention of internal combustion engines has had a marked influence on the means of transport; but the chief thing to note under this head in connection with commercial routes is that it has given increased importance to ordinary roads. Motor vehicles have thus the advantage over railways which railways have over internal waterways, that of bringing many more points into communication with one another, and so favour the dispersal of manufacturing industries, especially those for which cheap land and the possibility of bringing the producer into direct contact with the consumer are great considerations. Further motor roads, many hundreds of miles long, have been made on routes where railways are at present too expensive. One such road has been made on the ancient route from Beirut by Damascus and Baghdad to central Persia. The motor is also now used to link up the navigation of the Nile basin with that of the Congo, and to connect the railhead of the Benguela Railway with the navigation of the Upper Congo river. With motors of a special design successful journeys have even been made across the Sahara. In these ways the invention is one likely to benefit the mass of the people.

The same thing cannot be said of the aeroplane, the other vehicle that resulted from this invention. Notwithstanding the fact that the aeroplane can probably make use of great circle routes to an even greater extent than ocean vessels, there seems little prospect of this method of transport acquiring any considerable commercial value, and where it does so, as between large cities like London and Paris, that value is based essentially on the fact of there being enough exceptionally rich people to pay heavily for the luxury, whether for utility or for the gratification of their whims. True, the governments of most of the great powers have thought it worth while to subsidise this mode of locomotion, but that is as a "key industry"—that is, one carried on, apart from economic considerations, as being thought vital, at least indirectly, to the interests of the country—in this case probably not so much in the hope of the aeroplane becoming a really useful means of transport as because of the menace of its appalling efficiency as an agent in destruction.

A. A. U.; T. G. G.

CONIGLIANI, Carlo Angelo (d. 1901), an Italian economist, disciple of Ricca Salerno. He wrote chiefly on questions of public finance, and studied the application of the doctrines of the Austrian School of Economists to the theory of the incidence of taxation.

He published: *Un nuovo sistema di tariffe ferroviarie* (1890); *Teoria generale degli effetti economici delle imposte* (1890), his most important work; *Le dottrine monetarie di Francia durante il medio evo* (1890); *Il diritto publico nei sistemi finanziari* (1892); *Le leggi scientifiche della finanza* (1894); *L' indirizzo teorico della scienza finanziaria* (1894); *L' economia capitalista nel sistema economico del Loria* (1895); *Per l' imposta progressiva* (1896); *La riforma delle leggi sui tributi locali. Studi e proposte* (1898); *Saggi di economia politica e di scienza delle finanze* (1903) was published after his death.

E. L. H.

CONSIDÉRANT, Victor Prosper (1808-1893), was born at Salins, Jura, in 1808, and entered the polytechnic school in Paris in 1826. He became a captain of engineers in the French army, but falling under the influence of the doctrines of Fourier he gave up his post in 1830 in order to preach at Metz the theory of the phalanstery. He wrote in the papers that were issued by this school of Socialist thought, and on the death of Fourier in 1837 he became director of the review entitled *La Phalange*. The *Phalange*, however, succumbed to the difficulties which it encountered and was replaced in 1845 by a daily paper, *La Démocratie pacifique*. After the revolution of 1848 he was elected to the Constituent Assembly by the Department of Loiret, and to the Legislative Assembly by the Department of the Seine. He rarely spoke in the legislature, and brought forward proposals which only excited ridicule. Yet he preached "Fourierism" with moderation and refused to associate himself with the more extravagant of the earlier doctrines. Through his participation with Ledru-Rollin in the democratic movement of 13th June 1849 he was compelled to retire to Belgium, whence he sailed to Texas to make a fresh attempt at the application of his system. He returned to Brussels in the following year, where he was charged with conspiracy against the safety of the State and underwent a short term of imprisonment. On regaining his freedom he went back to Texas, where he established the communistic society of "La Réunion." He finally returned with his family to Paris, where he spent the remainder of his life in poverty.

He published: *Destinée sociale* (1834-44); *Théorie de l'éducation naturelle et attrayante* (1835); *Débâcle de la politique en France* (1836); *Manifeste de l'école sociétaire fondée*

par Fourier, ou Bases de la politique positive (1841); *Principes du socialisme* (1847); *Théorie du droit de propriété et du droit au travail* (1848); *Le Socialisme devant le monde, ou le vivant devant les morts* (1849); *La dernière guerre et la paix définitive de l'Europe* (Brussels, 1850); *La Solution, ou le gouvernement direct du peuple* (1851). E. L. H.

CONSULAR REPORTS,* BRITISH. Prior to the year 1886 the reports of diplomatic and consular officers abroad on trade, finance, etc., were published by the Foreign Office only during the session of Parliament, or shortly after its close, when a sufficient number had been received to make a fair-sized Blue Book. Under this system, a person requiring a particular report was compelled to purchase a volume containing much extraneous matter, possibly of no interest to him, and at a cost in excess of the value of this information. Moreover, while one report might be printed and ready for publication, it had to wait till others were received in a sufficient number to make up a Blue Book. The value of the earlier reports was thus diminished by delay. In 1886, in view of these objections, it was decided to publish each report separately, both during the session of Parliament and in the recess, and they were thenceforward issued promptly and at a price which rarely exceeded a few pence.

Ordinary Consular Reports were divided into two categories, "Annual" and "Miscellaneous." The former comprised reports on Trade, Finance, Agriculture, etc., annually required from His Majesty's missions and consulates abroad; the latter reports on subjects of general economic interest, either specially called for by the Secretary of State, or voluntarily submitted for publication by their authors. Between 1886 and 1916, 5566 Annual Reports and 687 Miscellaneous Reports were issued in the separate form. About 250 reports were published annually. Occasionally information was required from different countries on a specific subject, in connection with current legislative problems, etc. The replies were then all published together, thus consolidating the information in one book. Such collective reports were known as the "Commercial" series, *e.g.* the collection of reports respecting "Bounties on Shipbuilding, etc." (Commercial No. 4, 1901.) Annual Reports were intended, when possible, to reach the Foreign Office on or about the 31st March following the year to which they related. The majority of the reports appeared between April and August. Vice-Consuls sent their annual reports to the superintending Consul of their district, who forwarded them, after revision, as annexes to his own report. Thus the report of the Consul-General at Smyrna covered also the reports of the Vice-Consuls at Adalia, Aivali, Mitylene, Rhodes, Samos, Scala Nuova, Scio, and Tenedos.

Consuls were required to divide their Annual Trade Reports into distinct sections in the following manner:—

(1) Trade and Commerce; (2) Shipping and Navigation; (3) Population and Industries; (4) Other matters.

For details as to the variety of subjects to be dealt with under these main headings reference should be made to the article on COMMERCIAL INTELLIGENCE.

In important agricultural districts separate reports on Agriculture were required.

In the Agricultural Reports particular attention had to be paid to the nature and yield of crops, to the import and export of cattle, diseases of cattle, and other matters of interest to agriculturists. Outbreaks of disease among cattle had to be specially reported at the time of their outbreak.

The Miscellaneous Reports covered a very wide range of subjects, from the paper industry of Japan to the sea fisheries of Germany. From time to time Consuls have reported on such matters as Japanese paper mills; the arms industry of Liège; the German paper industry; the chemical, metal, and other industries of Lyons; the condition of the Italian silk trade; the coal industry of the United States; and on commercial instruction in Germany. These formed a valuable addition to our commercial intelligence. With a view to improve the quality of Consular Reports generally, it was arranged between the Board of Trade and the Foreign Office that newly appointed consular officers, before proceeding to their station, should attend for a short period at the Department of Overseas Trade (see COMMERCIAL INTELLIGENCE), 35 Old Queen Street, S.W.1, in order to become acquainted with the kind of information needed by business men. Consuls were also required to send important items of commercial information home without delay, by telegraph if necessary. Cases of urgency included information as to important contracts offered for tender, and important shipping movements or dock strikes in foreign ports. For an account of the methods adopted to secure the prompt transmission of such information to commercial men see under COMMERCIAL INTELLIGENCE.

A complete index to the Reports was published annually down to 1916, when publication of Consular Reports ceased. Consular officers are still required to report on the lines indicated above, but such reports have not been published since 1916.

A new series limited to the more important countries, and known as "Economic and Industrial Reports" (*q.v.*), has been substituted therefor. T. G. G.

CONSULS, BRITISH, DUTIES OF. A British Consul is required to advise H.M.'s trading subjects and others in his district, to avert and compose differences among them, or between them and the natives of the country, to check the evasion of local revenue laws by British traders, to uphold the treaty rights of British subjects in a temperate manner, to report on the trade of his district, and to send home promptly items of important commercial information.

Births and deaths occurring among British subjects are registered by him, and some Consuls are also empowered to celebrate marriages.

He may grant certificates of naturalisation to aliens and issue passports to British subjects. He may also advance for the erection or upkeep of Anglican churches, hospitals, and places of interment, sums equal to the amounts subscribed for the purpose by British subjects.

A Consul's duties with regard to British shipping are very important. Consuls are bound to send to the Board of Trade such reports and returns as they may require, and to see that all British vessels carry the documents and colours prescribed by law, and he may grant terminable and provisional certificates of registry as British ships.

If a Consul suspects that the shipping laws are being evaded, he may require the production of the official log-book or other ship documents, muster the crew, and demand explanations with regard thereto.

Every British ship not carrying passengers on entering a port must deposit with the Consul the agreement with the crew, indentures, etc.

The Consul superintends the engagement and discharge of British seamen abroad, investigates complaints made by crews as to the quality and quantity of the provisions on board, collects the property and arrears of wages, if any, of British seamen or apprentices dying abroad and remits them to the United Kingdom, and provides, out of public funds, for the maintenance and repatriation of seamen who are shipwrecked, discharged, or left behind. He issues money orders to seamen, receives deposits and pays withdrawals from the Seamen's Savings Bank, and conducts, at certain ports, the transmission of seamen's wages home.

Masters of passenger vessels are bound to give the Consul facilities for the inspection of the ship and the passenger list, and for communication with the passengers. The Consul may defray costs of maintaining and forwarding to their destination passengers taken off or picked up from wrecked or injured vessels.

The Consul makes inquiry on oath into offences committed by British seamen on the high seas or abroad ashore, and may send home the offender and witnesses by a British ship, at the same time reporting the facts to the Board of Trade.

He may detain a foreign ship which has caused injury to a British vessel until satisfaction or security therefor has been given, and when a salvage claim is made against a British vessel he takes evidence as to the services rendered and the remuneration claimed, and endeavours to effect a settlement.

Much notarial business is imposed on Consuls, partly by statute and partly by the request of private parties, and consists largely in taking declarations relating to the registry, sale, mortgage, etc., of British vessels, and to other commercial matters.

In China, Siam, Egypt, Persia, etc., British consular officers exercise extensive judicial and executive powers in connection with the consular courts established in those countries.

T. G. G.

CONVERSION OF BRITISH NATIONAL DEBT.* The Government borrowings to finance the War were on an altogether unprecedented scale, and in the course of the War a number of different forms of borrowing were tried with a varying degree of success. With the increasing demand for new loans and the less favourable rates obtaining, there was little to encourage the Government to enter upon conversion operations, and in so far as such operations were undertaken the object was mainly to postpone repayment of the capital amounts outstanding. The total debt of Great Britain at 31st March 1923 stood at £7,742,233,286, inclusive of the estimated capital liability in respect of terminable annuities, £11,015,100 owing to the Bank of England, and £2,630,769 owing to the Bank of Ireland. However, certain conversions were effected, of which the following are the principal. About £255,000,000 Consolidated stock 2½ per cent, £137,470,000 3½ per cent War Loan 1925-1928, £8,000,000 Annuities 2½ per cent, and £1,000,000 Annuities 2¾ per cent were converted into 4½ per cent War Loan 1925-1945 under an option offered to subscribers to that issue in 1915. When £5 per cent War Loan 1929-1947 and £4 per cent War Loan 1929-1947 were issued in 1917, an option to convert was given to holders of 4½ per cent War Loan 1925-1945, 5 per cent Exchequer Bonds 1919, 1920, and 1921, and 6 per cent Exchequer Bonds 1920, and 97·5 per cent, 61·9 per cent, and 12·9 per cent respectively were converted into the new War Loans. In June 1919 an issue was made of 4 per cent Funding Loan 1960-1990, and of 4 per cent Victory Bonds, and an opportunity to convert was given to holders of 4½ per cent War Loan 1925-1945, 5 per cent Exchequer Bonds, 1919, 1920, 1921, and 1922, 6 per cent Exchequer Bonds 1920, 4 per cent National War Bonds, 1st, 2nd, and 3rd Series, and 5 per cent National War Bonds, 1st, 2nd, and 3rd Series, with the result that £120,617,000 was converted into Funding Loan and £72,203,000 into

Victory Bonds. In April 1921 the Chancellor, seeing no immediate prospect of being able to fund the greater part of the existing floating debt, and desiring to avoid its increase or even a delay in its reduction as a result of the issue of Treasury Bills to meet maturing bonds, proposed to holders of 5 per cent National War Bonds due on or before September 1925 that they should convert their holdings into 3½ per cent Conversion Loan redeemable at the earliest in 1961. The terms were considered at the time far too generous, though in the long run effecting a saving to the taxpayer. The result, however, was disappointing, the total face value of the bonds converted being £163,328,133. In July of the same year holders of 5 per cent Exchequer Bonds due October 1921, and of 5 per cent National War Bonds due October 1922, April or September 1923, were invited to convert their holdings into a longer-dated loan of 5½ per cent Treasury Bonds repayable in 1929, and bonds of the approximate face value of £89,000,000 were converted.

At the beginning of April 1924 a further conversion operation was undertaken. In announcing its intention to convert £200,000,000 of 5 per cent War Loan 1929-1947 into a new loan bearing interest at the lower rate of 4½ per cent and repayable 1940-1944, the Treasury had a close and economical regard to the investment situation. Owing to the fact that interest on the War Loan is paid without deduction of tax at the source, whereas the interest on the new loan will be taxed at source, the operation was not expected to make a strong appeal to small holders. On the other hand, the yield of nearly 4¾ per cent for sixteen years certain, instead of a yield of just under 5 per cent for a certain period of not more than five years, appealed strongly to those interests which had to take into account the probable tendency of interest rates over the longer period. The operation resulted in the conversion of nearly £150,000,000 of War Loan, which may be regarded as a most successful result.

During the course of the War the Government was forced to raise large sums abroad, with the result that on 31st March 1923 the external debt amounted to £1,155,653,503. In the main this money was borrowed from the United States of America, and the desirability of converting these demand obligations into long-dated securities resulted in 1923 in an agreement between the respective Governments for the funding of our debt to the United States. Bonds to the principal amount of $4,600,000,000 were issued dated 15th December 1922 and maturing 15th December 1984, with interest payable half-yearly at the rate of 3 per cent per annum from 15th December 1922 to 15th December 1932, and thereafter at the rate of 3½ per cent per annum until the principal should be repaid. The agreement provides for the repayment of the principal sum by annual instalments, steadily increasing in amount from $23,800,000 in 1923 to $175,000,000 in 1984.

[For details of the conversion operations affecting the Internal Debt, see Kirkaldy, *British Finance, 1914-1921* (London, 1921), and *Stock Exchange Year Book*. For the funding of the American Debt, see Cmd. 1912 (1923).] F. W. G.

COPARTNERSHIP. *Labour and Capital.* The Copartnership system of the South Metropolitan Gas Co. (see TRADE UNIONS AND STRIKES) is one of the largest systems of this class in the United Kingdom. As an example of the general working of Copartnership principles we will explain how this system grew up out of the plan of profit-sharing in force in that company since 1889. In that year simple PROFIT-SHARING (*q.v.*) was introduced to attach the employees to the company, and to give them an opportunity to improve their position in life and to make provision for the future. The whole bonus was payable in cash on a week's notice, but nearly half was left with the company at interest, and a small portion invested in the company's ordinary stock. In 1894 the bonus was increased on condition that only one-half should be withdrawable, the other half invested in the company's ordinary stock. Thus shareholding by employees was established. The system was revised in 1901, and became so popular that in 1912, with a bonus amounting to £45,350, the sum invested in the stock of the company was £48,289, the value of these investments being over £380,000, with deposits at interest over £54,000 and £57,500, invested in the purchase of houses—the total being £491,000. In 1896 and 1897 Acts of Parliament were passed to enable employee shareholders to elect directors, and in 1901 the scheme for the election of workmen directors having proved satisfactory it was renewed for nine years, and provision made for the election of a director by the officers. These directors are elected by the employee shareholders whose stock is held in their own names, besides those whose stock is in the names of the trustees. When the question of employee directors was first considered there was the fear that they might take a narrow view of their duties. The directors and shareholders of the Metropolitan Gas Co. took that risk, and have no cause to regret their action. Copartnership, as Sir George Livesey said, is neither philanthropy nor charity, but business. It is "Business up to date,"—the foremost and best method of uniting capital and labour. He continued, "The directors would not be justified in continuing the copartnership if an equivalent in hearty service is not given for the bonus, which must

not be regarded as a gift to the employees," but that every man "is responsible for earning his share of the bonus."

Copartnership was established because the term "Profit-sharing" did not truly express the predominating idea of the system, and also because simple profit-sharing—the distribution of an annual bonus in cash—has been found to do more harm than good. Instead of encouraging thrift it did the reverse; it encouraged waste and extravagance. Unless any system permanently benefits, no good can be done. By investing the bonus in the stock of the company the position of the workman is improved. He becomes an owner of property, and has hope for the future and a feeling of security in the present. Sir George Livesey continues: "Partners in profits and losses and in responsibility is what we are aiming at. The last is obtained by the election of employee directors by the employee shareholders. In 1898 the workmen shareholders elected two workmen directors, and in 1901 the clerical shareholding staff elected a clerk as a director. These three sit on the Board, and take part in everything that comes before the Board just the same as the ordinary directors, with all-round satisfaction." The South Suburban Gas Co. (formerly the Crystal Palace District) have had an exactly similar and equally successful system in force since 1893, and in 1905 workmen directors were introduced, the choice of the men being the best possible, as in the case of the South Metropolitan. The Commercial Gas Co. introduced a similar system in 1901, and since then more than thirty gas companies, including the Gas Light and Coke Company and the Liverpool United Gas Light Company, have introduced the system also with success, but they stop at the investment of the bonus in stock.

Schloss, D. F., *Report on Profit-Sharing*, Bd. of Trade (Labour Dep.) [C. 7458], 1894.—*Report on "Gain-Sharing,"* Bd. of Trade (Labour Dep.) [C. 7848], 1895. — Sir George Livesey, *Employers and Employed and Co-Partnership.* (South Metropolitan Gas Company.) London: Walter King. Much information will be found in *Copartnership in Industry* by Charles Carpenter. London: Copartnership Publishers, Ltd., who also publish *Facts and Suggestions as to the Introduction of Co-partnership into Established Businesses by a Better Way*, Aneurin Williams, and the *Co-partnership Journal*; see also *Report on Profit-Sharing and Labour Co-Partnership in the United Kingdom*, Bd. of Trade, 1913.

Between 1829 and 1912, 299 profit-sharing schemes of all kinds were established, *i.e.* 204 between 1829 and 1900, of which 150 failed; 95 between 1901 and 1912, of which only 13 failed. The distribution of the 133 schemes in operation at the end of 1912 is as follows:—

	No. of Businesses.	No. of Employees.
Building, woodworking, and furnishing	6	320
Engineering, metal, and shipbuilding	5	17,499
Textile and clothing	12	6,588
Printing and paper	15	4,183
Transport	1	173
Agriculture	6	737
Chemical, glass, pottery, etc.	14	15,649
Food and tobacco	13	6,760
Gas works	33	28,246
Electricity supply	2	414
Other businesses	26	25,620
Total	133	106,189

COSSA, LUIGI (1831-1896), born in Milan, professor of Political Economy at the University of Pavia from 1858 till his death, was an economist to whom Italy is greatly indebted. He was educated at the University of Milan and in Germany under ROSCHER and STEIN, the former of whom influenced him strongly.

He was an indefatigable and ardent student of economic literature both past and present, both of Italian economists and those of other nations. The results of his studies are to be seen in his works, which are truly described as "noteworthy for the vast learning they contain, sobriety of expression, and temperateness and accuracy of method." His books have been translated into many languages, and one in particular, the *Introduction to the Study of Political Economy*, may be ranked as a classic.

Though it is by his books that Cossa is known to the world in general, it was by his personal influence as a teacher and a leader that he was valued in Italy. He was not only a brilliant and careful lecturer, but was always ready to help and encourage his pupils, inspiring them and exhorting them to labour. Though himself an adherent of the classical school, his sympathies were extended to all honest and industrious students no matter what method of thought they might have selected to follow. His principal works are:—

Guida allo studio dell' economia politica, Milan, 1st ed. 1876. Eng. trans. *Introduction to the Study of Political Economy*, 1892.—*Primi elementi di economia politica*, Milan, 1st ed. 1876. — *Primi elementi di scienza delle finanze.* — *Saggi di economia politica*, Milan, 1st ed. 1878.

[See *Economic Journal*, vol. vi., London, 1896.—*Handwörterbuch der Staatswissenschaften*, giving complete list of writings, vol. iii., Jena, 1900.]

COTTERILL, CHARLES FOSTER (earlier half of 18th century), criticised the theories of Ricardo in his *Examination of the Doctrines of Value.* He followed the arguments of Samuel BAILEY (*q.v.*), and opposes to the labour theory the cost of production theory of value.

The full title of his book is *An Examination of the Doctrines of Value as set forth by Adam Smith, Ricardo, M'Culloch, Mill, the author of A Critical Dissertation, etc., Torrens, Malthus, Say, etc., being a Reply to those Distinguished Authors*, London, 1831. [See Prof. Seligman "On some Neglected British Economists" in *Econ. Journ.*, Lond., 1903.]

COURCELLE-SENEUIL, JEAN GUSTAVE (1813-1892), was born at Seneuil, Dordogne, on 22nd December 1813. He at first was engaged in business, and then for a short period in 1848 was Director of Estates in the French Ministry of Finance. He subsequently devoted himself to the study of Political Economy, and was appointed Professor at Santiago, Chile, where he remained for ten years (1853-63). He then returned to France, and in 1879 he was nominated Councillor of State. In 1882 he was elected a member of the Académie des Sciences morales et politiques. In addition to his general work on Political Economy he published various treatises on banking. He wrote several articles in the Political Dictionary of Pagnerre, and the article "Charles Fourier" in the *Dictionary of Political Economy* (1851).

His works include: *Le Crédit et la banque* (Paris, 1840); *Traité théorique et pratique des opérations de banque* (1853; 9th edition, 1904); *Manuel des affaires, ou traité théorique et pratique des entreprises industrielles commerciales et agricoles* (1856); *Traité théorique et pratique d'économie politique* (2 vols., 1858-9); *Études sur la science sociale* (1862); *Leçons élémentaires d'économie politique* (1864); *Traité sommaire d'économie politique* (1865); *La Banque libre, exposé des fonctions du commerce de banque et de son application à l'agriculture* (1867); *Cours de comptabilité* (4 vols., 1867); *L'Intérêt et l'usure* (1867); *Liberté et socialisme* (1868); *L'Héritage de la révolution* (1871); *Précis de morale rationnelle* (1879); *Protection et libre échange* (1879); *Préparation à l'étude du droit: étude des principes* (1887); *Adam Smith* (1888); *La Societé moderne: étude morale et politique* (1892). He also contributed several articles to periodicals and newspapers.

E. L. H.

COURTNEY, LEONARD HENRY BARON (1832-1918), was born at Penzance on 6th July 1832. He was educated at St. John's College, Cambridge, was second wrangler and Smith's prizeman, and in 1856 became a fellow of his college. He then left for London to study law and was called to the bar in 1858. In 1860 he wrote a pamphlet on "Direct Taxation," in which he attacked MILL and BABBAGE and maintained that capitalisation was the only fair method of assessment for direct taxation. In 1864 he became a member of the staff of *The Times*. He joined the Statistical Society at this time, and five years later was elected to the Political Economy Club. He belonged to the group of Philosophic Radicals, and his economic standpoint was that of the individualist. His friendship with FAWCETT was undoubtedly founded on and promoted by a similarity of outlook. From 1872 to 1875 he held the chair of Political Economy at University College, London. He stood for Liskeard as a Liberal and was defeated in 1874, but was returned as member in 1876. He spoke often in Parliament on Eastern and Colonial questions, and was at this period an ardent supporter of Gladstone. He became in turn Under-Secretary for the Home Department, Under-Secretary for the Colonies, and Secretary to the Treasury. He was interested in the enfranchisement of women and in proportional representation, and on finding that the Suffrage Bill of 1884 failed to take any account of Proportional Representation he resigned from the ministry. He opposed Gladstone's Home Rule Bill in 1885 and became a Liberal Unionist. In the following year he was elected Chairman of Committees in the House of Commons. He always maintained an independent attitude, and his estrangement from the Unionist party was completed by the opinions which he expressed in connection with the Boer War. He attacked the policy of Tariff Reform and supported the movement in favour of bimetallism. In 1906 he unsuccessfully contested the constituency of West Edinburgh. In 1913 he was created a peer. Courtney's contributions to Political Economy include a dissertation on the Finances of the United States during the years 1861 to 1867, which was read before the Statistical Society; also an article entitled "Bimetallism Once More" (*Nineteenth Century*, April 1893), in which he favoured the system of International Bimetallism. His chief political work is *The Working Constitution of the United Kingdom and its Outgrowths* (London, 1901). He served on several Royal Commissions dealing with political and economic questions. In 1883 he married Miss Catherine Potter, a sister of Mrs. Sidney Webb.

His writings include: *Direct Taxation: an Inquiry* (London, 1860); an article in the *Nineteenth Century* for April 1893, "Bimetallism Once More"; the article on "Finance, 1837-1887," in Ward's *Queen Victoria*; *The Regeneration of Parliaments* (1905), reprinted from the *Contemporary Review*; *The Working Constitution of the United Kingdom and its Outgrowths* (London, 1901); *Peace or War?* (1910), reprinted from the *Contemporary Review*.

E. L. H.

CRAIG, JOHN.* In addition to the notice of Craig earlier in this volume, we may mention that his *Elements of Political Science* contains an exposition of the futility of Adam SMITH's distinction between productive and unproductive labour. Craig never accepted the fundamental tenets of the economics of RICARDO. He does not believe that wages are fixed by the standard

of life, and he is "opposed to the doctrine that wages and profits must vary inversely to each other." "Craig is the first English economist to emphasise the connection between value and utility, to disclose the fallacy of the supposedly necessary opposition between profits and wages, and to dwell on the analogy between the revenue from land and from capital." [See *Econ. Journ.*, London, 1903.]

CUNNINGHAM, WILLIAM, born at Edinburgh, 1849, died at Cambridge, 1919. His father was a Writer to the Signet in Edinburgh, and he was named after Colonel William Cunningham, who had served under Wellington in India. His mother descended from William Dunlop, a celebrated Principal of Glasgow University in the reign of William III. Cunningham was educated at the Edinburgh Institution, the Edinburgh Academy, and Edinburgh University. Thereafter he studied at Tübingen, and then entered at Caius College, Cambridge. There he read Philosophy and came under the influence of MAURICE and SIDGWICK. He obtained a first-class in the Moral Sciences Tripos in 1872, being bracketed "Senior" with F. W. Maitland. Failing to find a career in Philosophy, he was ordained by the Bishop of Ely in 1873, becoming curate of Horningsea, a parish some five miles from Cambridge, and later chaplain of Trinity, and curate of Great St. Mary's Church. During the period 1872-1881 he had become increasingly interested in economic and social questions. Through his appointment as examiner in the History Tripos he became aware of the need for teaching of economic history at Cambridge, and he undertook this work. That resulted in the publication of *The Growth of English Industry and Commerce*, the first edition of which appeared in 1882. During the next twenty-five years he continued his studies in this subject, adding to his book in successive editions, besides publishing a number of separate volumes which might be described as great appendices to the main work; *e.g. Christian Opinion on Usury*, 1884; *Alien Immigrants*, 1897; *Western Civilisation*, 1898, 1900; *Progress of Capitalism*, 1916. In addition, he had taken a prominent share in the University Extension movement, and attended many co-operative and labour congresses, as for instance in 1874, 1877, 1879. Also he had begun to widen his outlook by travel, having visited India in 1881-2. Probably he was the most travelled economist of his generation. In later years he journeyed through Europe, the United States, South Africa, and the Holy Land.

After being Birkbeck and Hulsean Lecturer, he was appointed vicar of Great St. Mary's, Cambridge, in 1887. He was an active vicar, but at the same time, as his list of publications shows, he continued his historical studies. In 1891 he was elected Tooke Professor of Economics and Statistics at King's College, London, an appointment which he held till 1897. During this period he was elected a Fellow of Trinity College, Cambridge, and in 1900 he served as Lecturer in Economic History at Harvard University, and fourteen years later he returned to the United States as Lowell Lecturer.

To some extent his general position as to the scope and method of economic inquiry, but probably to a larger degree his travels, made him keenly interested in the tariff issue, raised by Joseph Chamberlain in 1903, and for the next seven years he was a vigorous controversialist in favour of the policy of "fiscal reform." In addition to a number of articles in the press, he published *Failure of Free Traders to attain their Ideal*, 1903; *Rise and Decline of the Free Trade Movement*, 1906; *Wisdom of the Wise*, 1906; and *The Case against Free Trade*, 1910.

In 1907 he was appointed Archdeacon of Ely. The activities which had been devoted since 1887 to his work as vicar were now diverted to new tasks, and his position in the Church called for several works, though he still maintained his interest in economic history. To this side of his life belong *The Moral Witness of the Church on the Investment and Use of Wealth*, 1909; *Christianity and Social Questions*, 1910; *Causes of Labour Unrest*, 1912; *Christianity and Economic Science*, 1914; *Christianity and Politics*, 1916.

After being president of the Historical Society in 1911, and having completed the MS. of *The Progress of Capitalism*, he regarded his historical work as being closed, and proposed to turn his attention to Philosophy in its relation to Theology. He had already begun to contribute articles on F. D. Maurice to the *Ely Diocesan Gazette*, and just before his death was thinking of writing a life of Maurice.

Cunningham was an Hon. Fellow of Caius College, and one of the original Fellows of the British Academy. He attended most of the meetings of the British Association during a period of more than thirty years. As far back as 1883 he was Secretary of the Economic Section, of which he was President in 1891 and again in 1905. He was prominent in the founding of the Royal Economic Society, and his interest in women's education, and especially in the Women's Colleges at Cambridge, was great. The establishment of the Girton series of monographs was due to his liberality. It shows the width of his interests that he became associated with the Freemasons, in which body he was Grand Chaplain of England.

This condensed record of Cunningham's life suffices to show his many-sided activities and his tremendous power of work in varied fields. It does not, however, make sufficiently prominent another side of his character. He was most intensely interested in life; he was always learning everywhere; he was devoted in friend-

ship and had the power of inspiring others to do original work. Thus he may be said to have formed a school, in the sense of having established definitely a new subject of study and having secured others to follow after him.

It would be easy to explain in general terms the new impetus which Cunningham imparted to the study of economic phenomena in this country; but behind the mere fact is the significance and the meaning of the movement as far as that can be discerned at the present time. As regards the first, though there were creditable histories of special economic and social activities, at the beginning of the third quarter of the nineteenth century there was no good general history of the subject. The historical writing of J. R. M'Culloch and, to a less degree, that of Levi was revolting to any one with a historic sense, since they both judged the past according to principles arrived at by a previous study of economic theory. Valuable as is Thorold Rogers' monumental *History of Agriculture and Prices*, he wrote rather as a politician than as a scholar. Then, too, it was curious that in his over-emphasis on the economic side of history he, as it were, transplanted the conception of "the economic man" from the analysis of economic phenomena to the history of these. Cunningham differed altogether from his predecessors in his objectivity and insight. When he wrote about a period he seemed to have the capacity of living in it, and appreciating the point of view of those who were actors in far-distant times—"he was like the great dramatist who cannot be identified with any of the characters he creates." As Cunningham himself says, "he set himself to show how intimately the political and the economic history of the English nation have been interconnected, and to describe and account for the actual course of the material progress of the country." "Viewed in this way," in the words of Professor Foxwell, "economic history appears as one great concerted development, with something of the epic character." Cunningham's "real ancestry is to be found in such men as the author of the *Libelle of English Polycye*, as Thomas Mun and William Petty, and, above all, in the spirit that inspired Shakespeare and the great Elizabethans" (*Economic Journal*, xxix. p. 385). Yet Cunningham never attempted to write history in what is called the grand manner. His work is singularly devoid of "purple patches" and of epigrams—so often a self-set trap to catch the author himself. Rather he contented himself by telling a plain straightforward tale, but documented to the fullest extent. Then, as his *Growth of English Industry and Commerce* expanded, he added striking sayings collected from the writers of long ago, which gave added life and vividness to the whole narrative. To the completed work it is appropriate to apply his own generous words, used of another, "we should indeed be wrong if we forgot that the great stimulus came from the exhaustiveness of his monumental work and the inspiring influence of his example . . . ; if we can press a little further than he did, it is only because his genius opened up the way."

Cunningham thus placed the study of economic history in this country upon a firm foundation. He secured the co-operation of enthusiastic students of the subject. In his lifetime he had the gratification of seeing it incorporated into the curricula of the universities, and still more in finding that analytical economists were availing themselves of historical evidence in all cases where it helped to elucidate their inquiries. Even in the reports of Royal Commissions the same tendency is now firmly established.

This result was both less and more than that at which Cunningham aimed. It was more than what he can have expected in the eighties of last century, when the first edition of the *Growth of English Industry and Commerce* appeared. It was less in so far as it left the relationship of theory and history still undetermined. The views of Cunningham on the exact point of contact between economic analysis and economic history are nowhere clearly on record, though he often discussed this question in conversation. It is clear he did not believe in theory or abstract economics. In his inaugural lecture at King's College, London (1891), he insisted on the relativity of economic doctrine. An economic conclusion is "at best more or less generally true; it is never universally true" (*Economic Journal*, ii. p. 3). "Political economy does not give us definite information as to controlling necessities which human action cannot modify or direct, and which therefore limit human powers of righting any given wrong." Failing specific data, it is only possible to conjecture the chief lines of thought which led him to this conclusion. He was greatly, and no doubt unduly, impressed by some of the erroneous predictions from economic laws of certain of the later members of the Classical School. He contrasted the Absolute at which Philosophy aimed, and the universality which Science, in his day, claimed, with the limitations to which most economic reasoning is subject. Then, too, he was influenced by the trend of the German Historical School, though, later, he diverged from it, establishing his own work as essentially British. Finally, his point of view as a Churchman must be taken into account. Here he had a certain affinity with the schoolmen. He regarded Political Economy as a study of means towards the attainment of an ideal which is determined by religion or Ethics (*Economic Journal*, ii. p. 15). Therefore he was averse to the separation of economic phenomena as an isolated field of study, believing that, starting from the basis of economic motives, the ultimate reconciliation with the rest of man's nature (which was required

to reach a final result) was rarely made. It was for these reasons that he distrusted analytical economics, though he gives but slight hints as to what is to be put in its place. Possibly the clearest conception of Cunningham's position is to be gained from a saying of W. S. JEVONS, who describes (*State in Relation to Labour*, 1882, p. 29) the legislator as gathering to a focus the complex calculus of probabilities supplied by the scientist, the physicist, the economist, the moralist. Cunningham was too many-sided to be content to be an earnest economist in the narrow sense. He was rather like the "legislator" of Jevons who wanted to see the totality of social experience, and what resulted from it, and how its evils can be remedied.

[*Growth of English Industry and Commerce*, 1882 (and subsequent editions), 1892, 1896, 1903, 1905, 1907, 1910; (with Dr. E. A. CURRENCY (OR TREASURY) NOTES were first issued in this country as the result, not of deliberate and well-studied policy on the part of the Government, but as an emergency measure immediately following the outbreak of war in 1914. For an account of the events which led up to the passing of the Currency and Bank Notes Act, see DRAIN OF BULLION, App. This Act authorised the Treasury to issue currency notes for £1 and 10s. as legal tender for any amount. Clause 3 of Section I. provided that the holder of a currency note is entitled to obtain on demand at the Bank of England payment of the note at its face value in gold coin. No statement to such effect has, however, been printed on any of the notes so far issued, and it may be said that in general the public are ignorant of this provision. At first opinions were freely expressed that the issue of currency notes would have been rendered unnecessary had the banks continued to pay out gold as formerly. However, the great expansion in bank credit, rapidly increasing commodity prices and wages, prove that, sooner or later, an issue of currency notes would have had to be made. The outstanding issue of notes grew rapidly and continuously until the year 1920, and was assisted by the withdrawal of gold from circulation. Recognised banks were permitted to borrow currency notes through the Bank of England to an amount not exceeding 20 per cent of their liabilities on current and deposit accounts, the security being a floating charge on the bank's assets bearing interest from day to day at the current Bank Rate. This provision was withdrawn in December 1919, following the final report of the Committee on Currency and Foreign Exchanges after the War. The banks took nearly £13,000,000 in the initial stages of the crisis, but this amount was speedily reduced, and on 25th November 1914 only £239,000 remained outstanding. Since currency notes were first issued on 7th August 1914 their design has been changed twice. The number of forged notes discovered has not been great, considering the large amount of notes in circulation. In addition to the notes, Currency Notes Certificates are issued which entitle the holder, usually a bank, to demand from the Bank of England the amount of currency notes stated thereon.

A return showing the amount of currency notes outstanding and the composition of the Currency Note Redemption Account is published weekly as follows:—

CURRENCY NOTES.

(4 & 5 Geo. V., cc. 14 and 72.)

I.—ISSUE ACCOUNT.

Total issued up to 23rd January 1924 inclusive—	
£1 Notes	£2,270,077,549 0 0
10s. Notes	631,642,341 10 0
Currency Notes Certificates	177,540,000 0 0

Issued during the week ended 30th January 1924—			
£1 Notes			£6,172,520 0 0
10s. Notes			1,499,457 10 0
Currency Notes Certificates			50,000 0 0
TOTAL			£3,086,981,868 0 0
Total cancelled or called in up to 23rd January 1924 inclusive—			
£1 Notes	£2,051,778,411 0 0		
10s. Notes	591,601,551 10 0		
Currency Notes Certificates	158,390,000 0 0		
Cancelled or called in during the week ended 30th January 1924—			
£1 Notes	5,179,053 0 0		
10s. Notes	1,362,088 10 0		
Currency Notes Certificates	190,000 0 0		
TOTAL			£2,808,501,104 0 0
Outstanding—			
£1 Notes	219,292,605 0 0		
10s. Notes	40,178,159 0 0		
Currency Notes Certificates	19,010,000 0 0		
			278,480,764 0 0
TOTAL			£3,086,981,868 0 0

II.—BALANCE-SHEET.

Notes outstanding		£259,470,764 0 0
Certificates outstanding		19,010,000 0 0
Notes called in but not yet cancelled		1,422,892 10 0
Investments Reserve Account		11,768,920 18 8
TOTAL		£291,672,577 8 8
Currency Note Redemption Account—		
Bank of England Notes		£22,450,000 0 0
Gold Coin and Bullion		27,000,000 0 0
Silver Coin		7,000,000 0 0
Government Securities		235,097,506 2 3
Balance at the Bank of England		125,071 6 5
TOTAL		£291,672,577 8 8

N. F. WARREN FISHER,
Secretary to the Treasury.

TREASURY CHAMBERS,
31*st January* 1924.

On 15th December 1919 the Chancellor of the Exchequer announced the intention of the Government to give effect to the recommendation of the Committee mentioned above that the actual maximum fiduciary circulation of currency notes in any one calendar year should be fixed as the legal maximum for the next. The subsequent trade depression has resulted in a natural reduction in the demand for currency notes, so that up to the present the Government has not been called upon to stand by this deflationary measure. Fears have, however, been expressed that with a revival of trade and the consequent demand for additional currency, the Government would be forced to consider afresh the advisability of adhering to this decision, made at a time when trade was good and prices were still rising.

[For further particulars of the currency note issue and the Reports of the Committee on Currency and Foreign Exchanges after the War, see Kirkaldy, *British Finance, 1914-1921* (London, 1921).] F. W. G.

CURVES.* Curves of the kind introduced by COURNOT to represent the laws of supply and demand have now obtained an assured position in economic literature. Even De Foville, who generally directed his polished wit against the use of mathematics in Political Economy, admitted those simple curves. But it may be doubted whether the supply curve adapted to represent changes in the organisation of industry during long periods is equally suitable for general use. Of still more doubtful use is the analogous conception of a demand curve purporting to represent the *increase* of the demand price with the increase of the quantity offered for sale. This conception, due to Mr. Henry Cunynghame, is considered in a review of his *Geometrical Political Economy* in the *Economic Journal*, 1905. There is reference in the context to Mr. Cunynghame's important views on the issue between curves and symbols which is noticed in the above article. Even more complicated than Mr. Cunynghame's curves are the curves of "marginal supply price" and "marginal demand price" used by Professor Pigou in his *Wealth and Welfare* and *Economics of Welfare*. His constructions having been severely criticised in the *Economic Journal* (March 1924), Professor Pigou revised his treatment of the subject in the second edition of his *Economics of Welfare*.

F. Y. E.

DANSON, J. T. (1817-1898), a man of great versatility and varied experience, wrote on many economic questions, among them on our colonial policy, strongly setting forth the need of controlling colonists in their dealings with natives and with unappropriated land. He also wrote on our maritime trade both in peace and war, a subject he was conversant with through his connection as underwriter with the Thames and Mersey Marine Insurance Company. For a short time (1875-76) he lectured at Queen's College, Liverpool, on Political Economy—his lectures, almost homely in their simplicity, being published first as *Eleven Short Lectures on the Political Economy of Daily Life*, 1876, and afterwards forming the basis of one of his most important works, *The Wealth of Households*, 1886. Danson also assisted TOOKE in the fourth volume of the *History of Prices*, the help he gave being warmly acknowledged in the Preface to that volume. He practised for a time as a barrister, and

had some experience in journalistic work and in farming.

Danson also wrote on the accounts of the Bank of England, *Journal of Statistical Society*, 1847.—*Observations on the Speech of Sir William Molesworth on Colonial Expenditure and Government*, 1848.—*Notes on the Pilotage of the Port of Liverpool*, 1871.—*The Underwriting of 1872*, 1873.—*Of the proposed Legislation touching Maritime Contracts*, 1876.—*Underwriting in England, France, and America during the last three Years*, 1883.—*Underwriting of 1883-84 in England and Abroad*, 1885.—*Our next War in its Commercial Aspect; with some Account of the Premiums paid at Lloyd's from 1805 to 1816*, 1894.—*Our Commerce in War and how to protect it*, 1897.

DAVIDSON, JOHN (died 1905), appointed professor of Political Economy in the University of New Brunswick, Canada, in 1892, was educated at the High School, and at the University of Edinburgh. He graduated M.A. in 1891 and D.Phil. in 1897. He first published *The Bargain Theory of Wages*, 1898, containing a criticism of the wage doctrines of the 19th century, and a statement of the theory which the author himself held. There are two limits to the value of labour, the superior limit (determined by the employer's estimate) and the inferior (determined by the labourer's estimate). These limits "are not absolutely fixed; but, within the undisputed and permanent frontiers, each is comparatively free from the danger of aggression." The exact rate between these limits at which wages will be fixed "is determined by the comparative strength of the bargainers." The mobility of labour, trade unionism, and the methods of industrial remuneration, are then examined as factors in the determination of this rate. In this section the author argues that immigration is a consequence rather than a cause of prosperity.

In his *Commercial Federation and Colonial Trade Policy* (1900), he describes England's commercial policy towards her colonies since the treaty of Paris, and examines the present commercial relations of the mother-country with the rest of the empire. He concludes that the two proposals, free trade within the empire, and preferential treatment for the Colonies in the English market, are impracticable. The English Government, however, should discriminate against the foreigner, and stimulate colonial trade by granting "subsidies to freight steamers running between England and colonial ports."

Professor Davidson also contributed articles to the *Economic Journal* on "Canadian Preferential Tariff," 1900, and "Financial Relations of Canada and Provinces," 1905. At the time of his death "he had almost completed a history of the Scottish staple, which, from the fulness of treatment, was practically an economic history of Scotland for the period covered." J. H. J.

DECLARATION OF LONDON, 1909. This embodies the conclusions reached by the Naval Conference 1908-9, which was directed mainly to a settlement of the rights and liabilities of neutral trade in time of war. The Declaration deals with blockade, contraband, unneutral service, destruction of neutral prizes, transfer to a neutral flag, enemy character, convoy, resistance to visit and search, compensation for unlawful seizure, and interpretation. The Declaration was to cease to be binding when in a war between contracting Powers one of the belligerents is joined by a non-contracting Power. In the main the provisions of the Declaration were merely declaratory of the existing law, but in some important subjects they were the result of compromise between conflicting practices which failed to stand the test of war. The signatories were Austria-Hungary, France, Germany, Great Britain, Italy, Japan, the Netherlands, Russia, Spain, and the United States. The Prize Court Bill to give effect to the Declaration was passed by the House of Commons but rejected by the Lords. It was consequently not ratified by any Power.

Arts. 1-21 provide that a blockade must be confined to the enemy ports and coasts and must not bar access to neutral ports and coasts; it must be effective; it must be declared and notified, and must be impartial. Capture can only be made within "the area of operations," which abrogates the Anglo-American rules that a vessel is liable to capture which sails from a neutral port with intent to violate a blockade, and that a vessel which has succeeded in breaking "blockade outwards" remains liable to capture until the termination of her voyage.

Under the name of absolute contraband Art. 22 sets out a list of articles which may without notice be treated as contraband of war. By Art. 23 articles used exclusively for war may be added to the list of absolute contraband by a declaration to be notified. Under the name of conditional contraband the articles specified therein which are susceptible of use in war as well as in peace may without notice be treated as conditional contraband. Other articles of a like nature may by Art. 25 be added to the list of conditional contraband by declarations to be notified. The articles not susceptible of use in war which are specified in Art. 27 may not be declared contraband. The Declaration further prescribes the conditions of liability for the carriage of absolute and conditional contraband; the effect of the carriage of contraband on the vessel and the non-contraband cargo; and the mitigations of the penalty under certain conditions.

Absolute contraband is liable to capture if destined to territory belonging to or occupied by the enemy. Here the destination of the goods is the test. Even if the vessel is bound

for a neutral port and the goods are discharged there, the latter will be liable if ultimately destined for the enemy territory. Here the doctrine of continuous voyage applies. The onus of proof lies on the captor, Arts. 30-32. Conditional contraband is only liable to capture if destined for the use of the armed forces or of a Government Department of the enemy. Such destination is presumed if the goods are consigned to an enemy contractor who notoriously supplies goods of like nature to the enemy or to a fortified place or base of operations belonging to the enemy. The doctrine of continuous voyage does not apply to conditional contraband, except where the enemy country has no seaboard, Arts. 33-36. A vessel remains liable to capture throughout the whole of her voyage, but when the voyage is concluded no further liability attaches, Arts. 37, 38. Contraband goods are liable to condemnation and the vessel carrying them also if by value, weight, volume or freight they form more than half the cargo, Arts. 39-40. If they form less the vessel may be allowed to continue her voyage upon handing over the contraband goods, Art. 44.

Unneutral service may be either partial or complete. By Art. 45 a neutral vessel engaged in carrying military persons or despatches concurrent with other employment of an innocent nature is liable to capture as if engaged in the carriage of contraband. By Art. 46 a neutral vessel in the exclusive service of the enemy—*e.g.* taking a direct part in the hostilities; acting under the orders or control of an agent placed on board by the enemy Government; in the exclusive employment of the enemy Government; or exclusively engaged in the transport of enemy troops or in the transmission of intelligence in the interest of the enemy—is to be treated as an enemy vessel. By Art. 47 individuals embodied in the armed forces of the enemy may be taken out of a neutral merchant vessel. By Art. 48 a neutral vessel may not be destroyed, but by Art. 49 she may be destroyed if she would have been liable to condemnation and her release would involve danger to the safety of the warship or to the success of its operations. By Art. 50, however, before destruction all persons on board must be placed in safety and all the ship's papers, etc., secured. As a general rule the transfer of an enemy vessel to a neutral flag, whether before or after the outbreak of the war, is valid unless shown to have been made to evade the consequences of war. If made before, the onus of proving it invalid lies on the captor; if made after, on the neutral, Arts. 55 and 56. In its application the general rule is subject to numerous subsidiary provisions.

The character of the vessel is determined by the flag she is entitled to fly and of the goods found on board an enemy vessel by the neutral or enemy character of the owner. In the absence of proof to the contrary they are presumed to be enemy goods, Arts. 506-7. Neutral vessels under convoy are exempt from search provided the commander of the convoy gives all the necessary information, Art. 61. Forcible resistance to visit and search entails condemnation of the vessel, and the cargo is liable to the same treatment as that of an enemy vessel, Art. 63. By Art. 64, if the vessel is not condemned or is released the parties interested are entitled to compensation unless there were good grounds for the capture.

Upon the outbreak of the War all the belligerents adopted the Declaration of London, but with important modifications. Great Britain and her Allies at once added to the list of absolute contraband contained in Art. 22, and as the War progressed enlarged it from time to time at the expense of Arts. 24 and 28. Indeed, the "Free List" contained in the latter practically disappeared. As was said, everything from a hundred-ton gun to a lady's garter had become contraband. Food-stuffs, however, remained in the British and German lists as conditional contraband. Great Britain continued to treat all fuel, except mineral oils, which she declared absolute, as conditional contraband, while Germany on the other hand treated coal, coke, and mineral oils as absolute and other fuel as conditional contraband. In 1916, coin, bullion, paper money, and negotiable instruments were declared by the Allies absolute contraband. They had already been so declared by Germany. Raw cotton was at first retained by the Allies on the "Free List," but as its prime importance for high explosives became recognised they eventually declared "raw cotton, linters, cotton waste, cotton yarns, cotton piece goods, and other products capable of being used in the manufacture of explosives," absolute contraband.

Cotton had already been declared absolute contraband by Germany. The articles enumerated in Art. 29, viz. for the use of the sick and wounded and for that of the vessel in which they are found, were treated as free by the Allies, but Germany regarded all armament, even for defensive purposes, as illegal. By the British and French Orders of 7th July 1916, whereby the Declaration of London was abandoned, all commodities directly or indirectly of use to the enemy in the prosecution of the War were declared absolute contraband. Germany by treating conditional contraband as absolute if destined to the enemy military forces, or to the central administrations, or to a port of supply, arrived at the same result. Every British port was treated as a base of supplies.

By this extension of the lists of contraband, combined with the application of the doctrine of continuous voyage, little was left of the rule "free ships, free goods," enunciated in the

Declarations of London and Paris. Although, for instance, conditional contraband by Art. 35 of the Declaration was not liable to capture if bound for a neutral port, it was by Order in Council, 29th October 1914, declared liable if consigned "to order," or if the ship's papers did not disclose the consignee, or if they disclosed a consignee in enemy territory. Art. 38 was modified by Orders in Council, 20th August and 29th October 1914, by which a neutral vessel which succeeded in carrying contraband by means of false papers might be captured on her return voyage, and a neutral vessel with papers indicating a neutral destination but which proceeds to an enemy port, might be captured if encountered before the end of her next voyage. The right to destroy neutral prizes, subject to prescribed conditions, was interpreted by the Germans as a right to sink at sight without any regard to the conditions or general humanitarian restrictions. By the withdrawal of the Declaration the customary rule that a neutral merchantman must in no circumstances be destroyed is restored.

[Pitt-Cobbett's *Leading Cases on International Law*, 4th ed., 1924, by Bellot.] H. H. L. B.

DEVAS, Charles Stanton (1848-1900), was educated at Eton and at Balliol College, Oxford, where he took first-class honours in Law and Modern History. He was Professor of Economics at Stonyhurst College. His works were written from the standpoint of Roman Catholicism, and dealt largely with the application of morality to political and economic questions. Thus he published in 1876 a pamphlet entitled *Labour and Capital from the Catholic point of view*, and in 1888 *Political Economy*, one of the manuals of Catholic Philosophy in the Stonyhurst Series. He also took part in current controversy by writing an introduction to Sir John Byles's *Sophisms of Free Trade* (1904).

His works include: *Labour and Capital in England from the Catholic point of view* (London, 1876); *Groundwork of Economics* (1888); *Political Economy* (1888); *The Meaning of Christian Democracy* (1899); *The Key to the World's Progress, being an Essay on Historical Logic* (1906). E. L. H.

DISEASES OF ANIMALS ACTS AND THEIR ADMINISTRATION. The first serious attempt by the State to control animal epidemics was embodied in the Contagious Diseases (Animals) Act, 1848, under which Sheep-Pox, then prevalent, and the great cattle-plague outbreaks of 1865-66 were dealt with. This Act and its amendments gave place to the Contagious Diseases (Animals) Act, 1869, which conferred extensive powers upon the Privy Council and upon local authorities to deal with animal diseases. Agricultural opinion was not, however, favourable to the full exercise of these powers, with the result that neither the Act nor the Orders thereunder were properly enforced. A revival of the movement in favour of more drastic measures for the suppression of animal epidemics, particularly foot-and-mouth disease, led to the replacement of the Act of 1869 by that of 1878, which formed the basis for the present legislation. The latter and its amendments were consolidated by the Diseases of Animals Act, 1894, and this, with its eight subsequent amending Acts, is still in operation.

The main principles and methods of working of the Acts of 1894 to 1922 are briefly as follows:

The Act of 1894 imposes upon the Ministry of Agriculture, as the central authority, the duty of devising and putting into operation measures for the control and eradication of contagious diseases amongst animals in Great Britain. It confers upon the Ministry wide powers to make Orders for these and other specified purposes, including the declaration of infected places and areas, the prohibition or regulation of movement of animals into, out of, or within such places or areas, or the exposure of animals at markets, etc., the control of the importation of foreign animals, and the protection of animals from unnecessary suffering during transit by land or sea. The Act requires the local authorities and the police to execute and enforce the provisions of the Act and of the Orders of the Ministry thereunder. The Local Authorities defined for the purposes of the Act, which number 330, are the County Councils, the County Borough Councils, and the Councils of certain other boroughs and burghs. All these are required to appoint their own veterinary and other inspectors to carry out the duties imposed upon them, and their expenses have to be defrayed out of the local rate.

The Act of 1896 amended the Act of 1894, so as to prohibit the importation of foreign animals except (*a*) for slaughter at the ports, and (*b*) for exhibition or other exceptional purposes subject to quarantine at the port of landing. The Orders of the Ministry under the Act of 1894 prohibit the importation of animals even for slaughter at the ports, from all countries except Canada, United States, South Africa, Ireland, the Channel Islands, and the Isle of Man.

The Act of 1903 empowers the Ministry to make Orders prescribing the periodical treatment of all sheep by effective dipping or some other remedy for sheep-scab.

The Act of 1909 requires the payment of fees to veterinary surgeons notifying cases or suspected cases of disease under any Order of the Ministry.

The Act of 1910 prohibits the export of horses unless examined by a veterinary inspector of the Ministry immediately before shipment and certified by him as fit to travel without suffering. This Act was extended by the *Exportation*

of Horses Act, 1914, which requires the veterinary inspector to certify that the horses must be capable not only to travel, but also to work without suffering. The effect is to prohibit the export of decrepit horses. The Exportation and Transit of Horses Order of 1921 regulates the traffic, requires the vessels engaged in it to be specially fitted, and makes provision for proper food, water, and attendance for the animals carried.

The Poultry Act, 1911, empowered the Ministry to make Orders for the protection of poultry from unnecessary suffering during transit. These powers have been exercised in the Conveyance of Live Poultry Order of 1919.

The Importation of Animals Act, 1922, provided for the importation of Canadian store cattle for feeding purposes in this country, subject to inspection at the ports and to a limited period of detention after arrival at the place of destination.

The following animal diseases are at the present time "scheduled" for administrative action under the Acts, viz. cattle-plague, contagious pleuro-pneumonia of cattle, foot-and-mouth disease, sheep-pox, swine-fever, sheep-scab, anthrax, rabies, glanders, epizootic lymphangitis, parasitic mange in equines, and bovine tuberculosis. The Tuberculosis Order, which was brought into operation for the first time in 1913, was suspended during the War, and remained suspended for reasons of economy at the date of this article (July 1924).

The above diseases may be divided into two classes: (*a*) those in which the diagnosis is in the hands of the Ministry's officers, namely, cattle-plague, pleuro-pneumonia, foot-and-mouth disease, sheep-pox, and swine-fever; and (*b*) those in which the diagnosis is carried out by officers of the local authorities, viz. anthrax, sheep-scab, glanders, rabies, epizootic lymphangitis, parasitic mange of equines, and bovine tuberculosis. In anthrax and rabies the diagnosis is subject to confirmation by the Ministry.

In cattle-plague and pleuro-pneumonia, the slaughter of affected animals is obligatory upon the Ministry, in sheep-pox upon the local authority. In foot-and-mouth disease slaughter is not obligatory, but may be carried out at the discretion of either the Ministry or the local authority. In swine-fever slaughter as a "stamping-out" policy was given a prolonged trial over many years at great expense, but without success. The attempt to stamp it out was abandoned in 1915 in favour of control, and slaughter is now only carried out where necessary to provide a means of diagnosis by post-mortem examination.

Of the diseases mentioned in class (*b*), slaughter is obligatory upon the local authority of affected animals in cases of glanders and bovine tuberculosis, and also of dogs and cats which are affected with or suspected of rabies or are known to have been bitten by a rabid dog. Remedial measures are applied to cases of sheep-scab and parasitic mange in equines. Anthrax in animals is practically always fatal, and slaughter is expressly avoided, as the spilling of the blood which swarms with anthrax bacilli is attended with great danger both to human beings and also to other animals. Cremation is the usual method of destruction of the carcases.

The above measures are accompanied by restrictions on the movement of the animals on the infected premises, with the object of preventing the spread of infection to other stock. Persons guilty of an offence in respect of these matters are liable to a penalty of £20, or £5 in respect of each animal where more than four animals are concerned, and in certain cases to imprisonment.

Where slaughter of any animals, except dogs and cats, is carried out by the Ministry or by local authorities, they are required to pay to the owner compensation. The amount of this varies with the disease and according to whether the animal is diseased or not. In view of the fact that the object of the provision made in the Act of 1894 for the payment of compensation is very frequently misinterpreted, it should be explained that compensation is not provided for the purpose of reimbursing an owner for losses incurred through outbreaks of disease amongst his stock; such losses are ordinary trade risks connected with the livestock industry, and are to a large extent insurable. Compensation is provided to enable the Ministry compulsorily to acquire the ownership of any animals which it considers should be slaughtered in the public interest. These animals become the property of the Ministry, which pays the owner compensation according to the prescribed scale.

Great Britain has been happily free from cattle-plague since 1877, from pleuro-pneumonia since 1898, from epizootic lymphangitis since 1906, from sheep-pox for many years, and from rabies since 1921. Foot-and-mouth disease is recorded as having first appeared in Great Britain in 1839, and has been intermittently present ever since that year. The country was subject to severe epidemics of this disease from 1869 to 1872, when the number of animals attacked was estimated at three millions. Another severe visitation commenced in 1880, and was not eradicated until 1886; in 1883, no fewer than 18,732 outbreaks were notified. It is estimated that 800,000 animals were attacked during this series of outbreaks. The country enjoyed periods of freedom from foot-and-mouth disease from 1886 to 1892, from 1895 to 1899, and from 1903 to 1907, but from 1892 to the present the number of infected premises has

never exceeded 100 in any year except in 1922, when 1140 outbreaks occurred, in 1923, when the number of outbreaks reached 1894, and in 1924, when the number of outbreaks had reached 1260 up to the 30th June. It would appear that since the War some fresh factors have come into operation tending to increase the susceptibility of this country to the invasion of foot-and-mouth disease from outside sources. The policy hitherto adopted, known as the "slaughter" policy, entails considerable expenditure when the outbreaks become numerous, and the discovery of some preventive agent would reduce the necessity for slaughter by a large percentage, and consequently the expenditure involved in effecting eradication. Departmental committees are investigating this subject.

As regards glanders, the adoption of the Mallein test in 1907 as a diagnostic agent has effected a reduction in the number of outbreaks from 1066 in 1906 to only 9 in 1923. Entire eradication of this disease from Great Britain is anticipated, the problem thereafter being one of the prevention of its reintroduction by horses imported from abroad. At present these are required to be accompanied by satisfactory veterinary certificates.

Swine-fever is a serious infectious disease which, if not kept under control, would have grave effects upon the pig-keeping industry generally. The average number of outbreaks per annum during the last five years has been 1753.

Sheep-scab can be eradicated by efficient double-dipping; that is, dipping twice with a maximum interval of 14 days between the two dippings in a dip approved by the Ministry for this purpose. The enforcement of compulsory dipping has had a salutary effect in reducing the prevalence of the disease from 1792 outbreaks in 1903 to 689 in 1923. The problem of eradication is one for sheepowners themselves to solve, and the Sheep-Scab Order of 1923 renders an owner liable to heavy penalties if disease appears amongst his sheep, unless he can prove that he took adequate measures to keep his sheep clean.

Parasitic mange in equines can also be eradicated by proper treatment. The number of cases has been reduced since the Ministry in 1911 first applied general measures for its suppression, from 2873, involving 6068 affected horses, to 796 outbreaks in 1923 with only 1126 horses attacked.

The Act of 1894 empowers the Ministry by Order to add other diseases to the list of those to be dealt with by state action. Some of the more serious diseases in animals, such as contagious abortion in cattle, Johne's disease, etc., do not lend themselves to action by administrative order, either because the nature of the disease renders this impracticable or because the imposition of such measures of control as would be necessary would interfere unduly with the industry and thus make the remedy applied worse than the disease itself. In recent years facilities have grown up enabling livestock owners to an increasing extent to indemnify themselves by insurance against losses due to disease amongst their stock. W. P. S.

DOCKS.* The article Dock in the body of this Volume, revised in 1911 and 1924, describes the recent progress in the dock system of this country. Considerable progress has been made in the docks at Bristol, which at the present time cover 144 acres. The Royal Edward Dock will accommodate vessels much larger than any now (1912) afloat. The railway connections of the dock are very complete, and quick-working cranes and elevators afford facilities for the loading and quick despatch of cargoes of all descriptions—grain, ore, green fruit, etc. At Southampton great improvements have been made, the depth of water available and the quay accommodation increased, with two very fine graving-docks. The arrangements for dealing with cargoes, both for import and export, have been greatly improved.

One of the most important questions for the prosperity of the trade of England, namely, the development of the Port of London, after remaining for several years in abeyance, was cleared up by the Port of London Act 1908. The Annual Report of the Port of London Authority (March 1912) states what has occurred since. The trade of the Port was greatly hindered by the strikes in 1911. With these troubles it is not wonderful that while the shipping which paid Dock dues showed an increase of 208,690 tons during the year ended March 1912, the shipping entering the dry docks during the same time was 77,222 tons less than in the previous year, and the value of the total trade showed a decrease of nearly £8,000,000. The improvements of the Dock accommodation which had been agreed on were commenced during the year at a cost of £3,896,700, as well as the deepening of the navigable channel of the river. The most recent surveys show that there is improvement along the whole line of the channel of the Nore which the authority decided to dredge. Much, however, remains to be done, and the intricacy of the questions affecting the flow of the water in the river Thames, and hence the position of London as a port, require the most careful attention of the Legislature. The superiority of the trade of London still continues. The total foreign trade for the six leading ports of the United Kingdom for 1911 was as follows:—

United Kingdom	£1,237,035,959
London	368,202,536
Liverpool	336,439,017
Hull	71,453,077
Manchester (including Runcorn)	54,143,473
Southampton	47,216,924
Glasgow	47,135,993

Meanwhile the tonnage at the ports of Rotterdam, Hamburg, and Antwerp, three of the principal competitors of London, has increased in a far greater proportion, with greatly improved methods of dealing safely and rapidly with the goods consigned. In England closer communication with the entire railway system of the country is essential.

Since the opening of the new dock at Immingham by the King in July 1912 the progress up to April 1913 has been rapid. The chief feature is the shipment of coal, some three-quarters of a million tons having been shipped during the six months. Large quantities of iron ore from Sweden and log timber from the Baltic have been imported. Regular sailings by the Peninsular and Oriental Steam Navigation Company, the Wilson, Glen, and Hamburg-American Lines to India, the Far East, Australia, the West Indies, and South America have been inaugurated, the cargoes consisting principally of cased goods from the West Riding and Lancashire. A huge granary is provided with all the latest improvements for handling every class of grain. The timber trade will develop rapidly, as there is a large timber-pond with deep water berths, and also enormous timber yards with specially laid-out sidings and machinery of the very latest type. The ships taking coal are rapidly handled. The eight hydraulic hoists can each load 700 tons per hour. The hydraulic cranes vary from 30 cwts. to 50 tons, being principally 2 ton and 10 ton double-power luffing cranes; while on the mineral quay a 50-ton crane with luffing jib is being erected, also a large number of 3 ton and 5 ton double-power gantry type cranes. In the transit sheds are a number of 30 cwt. electric cranes. For the purpose of carrying timber in the yards there are several fast-travelling steam cranes. The area of the dock property is 1000 acres, the area of the dock 45 acres, the depth of water on sill at lowest and highest state of the tide is 27½ feet and 47 feet respectively. There is a magnificent graving dock 740 feet long, with 22 feet of water on blocks, which can accommodate vessels of 5000 tons gross. At this dock there is a travelling crane the full length of one side of the dock capable of lifting 15 tons at the centre with an auxiliary lift of 3 tons at 75 feet radius. Workshops are being erected and up-to-date machinery installed for the rapid and economical repair of all sorts of damage and overhaul work.

British Harbours.—In 1922 the arrivals and (*in italics*) departures in millions of tons at the various ports were as follows:

London, 14·4, *11·4*; Liverpool, 11·2, *10·5*; Cardiff, 6·9, *8·9*; Newcastle, 7·2, *8·1*; Southampton, 6·7, *6·6*; Hull, 4·9, *4·5*; Glasgow, 3·3, *4·2*; Plymouth, 4·3, *4·1*; Newport, 2·1, *2·8*; Middlesborough, 2·0, *2·0*; Swansea, 2·2, *2·7*; Manchester, 2·4, *2·0*; Bristol, 1·9, *1·7*.

The Ownership of Docks by the various Railway Companies is as follows:

London, Midland and Scottish Railway Co.—Barrow-in-Furness, Ellesmere, Fleetwood, Garston, Runcorn, Widnes.

Great Western Railway Co.—Cardiff, Barry Docks, Barry Port Dock, Newport, Penarth.

London North-Eastern Railway Co.—Great Grimsby, Hartlepool, Harwich, Hull (all docks), Immingham, King's Lynn, Lowestoft, Middlesborough, Silloth, South Shields, Sunderland (Wearmouth Dock), Alloa, Bo'ness, Grangemouth, Methil.

Southern Railway Co.—Southampton.

E. L. H.

DOWELL, Stephen (1833-1898), for many years Assistant Solicitor to the Board of Inland Revenue, wrote a useful work on the *History of Taxation and Taxes in England*, a subject with which, through his official duties, he was thoroughly familiar. Of the four volumes into which the work is divided, the first two are devoted to the history of taxation as connected with the general current of English political events, arranged in periods, extending from the days of the Romans in Britain to the year 1885, while in volumes iii. and iv. the different taxes taken separately are discussed and grouped under their several headings, as Direct Taxes, Taxes on Persons, on Property, etc. A second edition of the *History* appeared in 1888.

Dowell also published: *History and Explanation of the Stamp Duties*, 1873.—*The Income-Tax Laws in force in the United Kingdom*, 1885.—*The Acts relating to the Tax on Inhabited Dwelling-Houses*, 1893.

DRAGO DOCTRINE. In 1848 Lord Palmerston declared that it was not the policy of the British Government to assist its subjects in enforcing their claims against a foreign state, although it was undoubtedly the international right of every state to do so. Nevertheless, the loss to British subjects might be so great that it would become the duty of the British Government to intervene, even to the length of using armed force. These principles were re-affirmed by Lord Salisbury in 1880. In December 1902, Great Britain, Germany, and Italy instituted a blockade of certain ports of Venezuela in order to enforce certain claims, contractual as well as tortious, presented to the Venezuelan Government by their respective subjects. Dr. Louis Drago, the eminent jurist and Minister of Foreign Affairs of the Argentine Republic, in a Note to the American Government laid down the principle "that the public debt cannot occasion armed intervention nor even the actual occupation of the territory of American nations by a European power." Later, he drew a distinction between the public loans of a state and other forms of contractual obligations. He contended

that bonds constitute an exceptional class of obligations; because (1) they are issued by the sovereign power of the state pursuant to legislation; (2) they are made payable to bearer; (3) the purchaser buying the bonds in the open market acquires his rights as obligee without other formality or relation with the debtor government; and (4) when payment is for any reason suspended, there is no means of appeal by judicial action or otherwise to the debtor state, inasmuch as the suspension of payment occurs by virtue of the sovereign authority of the state.

That is to say the repudiation of the contract by the obligor state by the exercise of sovereign power removes from the state of the obligee the right to take steps, which it might have taken, if the obligor had not made use of its sovereign power. But obviously such exercise of sovereign power, by reason of the consequences which it entails, necessarily produces an international issue, the solution of which the state of the obligee is entitled to demand.

This doctrine failed to obtain general recognition. By Convention II., however, of the Hague Conference, 1907, entitled the "Limitation of the Employment of Force for the Recovery of Contract Debts," the Contracting Powers agreed not to have recourse to armed force for the recovery of contract debts claimed from the Government of one country by the Government of another as being due to its nationals. But if the debtor state refuses or neglects to reply to an offer of arbitration, or, after accepting such offer, prevents any "Compromis" from being agreed on, or after arbitration fails to submit to the award, the creditor state may resort to armed force. This provision recognises that an international judicial remedy, such as arbitration by the Permanent Court of Arbitration at The Hague, must be exhausted before an appeal to armed force becomes justifiable. Thus "a debtor state is protected by the law until it puts itself outside the law" by rejecting one or other of the reasonable conditions contained in the Convention. This scheme was due to General Horace Porter, a delegate of the United States, and it received the support of Dr. Drago, although it did not go to the length proposed by his doctrine. It is believed that the Convention covers all forms of indebtedness of a state to an alien, embracing without distinction public loans evidenced by bonds, and that the adjustment of any issue arising from non-payment is contemplated, whether or not resulting from a repudiation of its contract by the debtor state through the exercise of its sovereign power.

H. H. L. B.

DRAIN OF BULLION.* For a number of years before the outbreak of war in 1914 the adequacy of our gold reserves had been a subject of widespread interest and earnest discussion, and there were not wanting those who predicted disaster if our financial system were, for any reason, faced with a sudden crisis. The test to which that system was subjected in the fateful days of July and August 1914 is, therefore, of extraordinary interest. The market in London was by 24th July already very much depressed owing to the political disturbance in Ulster. When to this was added a feeling of uncertainty as to the outcome of events on the Continent, dealings on the Stock Exchange became steadily more difficult. Quotations fell, and at the same time the English finance houses adopted an extremely cautious policy, refusing to renew expiring loans. The result was a strong demand abroad for sterling to meet overdue debts, and the value of sterling rose quite abnormally. There was a rush to sell securities in the Stock Exchanges all over the world, for everyone wanted ready money to meet possible emergencies. The London Stock Exchange was forced to close on 31st July, for to have kept open longer would have made England the dumping ground of the world, and gold would have poured out of the country in exchange for the securities realised. The most liquid resources of the banks, employed in the discount of bills, in advances at call and short notice, and to the Stock Exchange, were locked up and could not be called in. The Bank of England was the only resort for borrowers, and for its own protection it was forced to raise its discount rate from 4 per cent to 8 per cent on 31st July, and to 10 per cent on 1st August. A relief from the tension in the City was of the utmost importance, and accordingly the Bank Holiday was extended by Royal Proclamation from the 4th to the 6th of August. The Bank of England received from the Government the usual letter indemnifying it against issuing notes in excess of the limits fixed by the Bank Act of 1844, but only for a few days was it necessary for the bank to avail itself of this protection. In the meantime there was a general lack of change due to the banks being closed and, owing to the action of some of the banks in paying their customers in Bank of England notes instead of gold during the previous week-end, there was a queue at the bank waiting to secure gold in exchange for these notes. To protect the gold reserve of the Bank of England and to provide additional cash resources for the banks, the Government decided to issue emergency currency in the form of notes for £1 and

10s. To this end an Act, known as the Currency and Bank Notes Act, was passed on 6th August, and currency notes were in the hands of the public on the following day. The holder of a currency note was, and still is, entitled to obtain on demand at the Bank of England, London, payment for the note at its face value in legal tender gold coin. Postal Orders and Scotch and Irish Bank Notes were also temporarily made legal tender for the payment of any amount. Provision was made for currency notes to be issued to bankers through the Bank of England up to 20 per cent of their liabilities on deposit and current accounts. Such advances were made use of only for a short period, and the provision has since been withdrawn.

The effectiveness of these measures in protecting the gold reserve of the country may be judged from the following figures, given in the *Journal of the Institute of Bankers*, December, 1914. On 23rd July the gold held by the Bank of England was £40,164,000. Between that date and 30th July the bank lost, on balance, £2,032,000. Of this, £1,212,000 was withdrawn for home circulation and £1,218,000 was exported. The greater part of the amount exported was taken by France and Belgium, and only £275,000 went to the rest of the Continent, which we may assume to be Germany. The following week, the week of the outbreak of war, the Bank's stock of gold was reduced by £10,510,000 and the stock fell to £27,622,000. The total amount exported in that week was £2,740,000, of which France and Belgium took £1,678,000. Of the remainder, Switzerland, Egypt, Gibraltar, and Malta took between them £490,000, and the rest of the Continent the balance exported of £572,000. In the course of five weeks "the Continent," which we may assume to be Germany, took altogether £862,000. During these same weeks, the arrivals of gold from South Africa and other sources were between $3\frac{1}{2}$ and 4 millions. This amount, after satisfying the requirements of India and the trade, was either taken by Paris or went into the Bank of England. There is no evidence, therefore, that Germany raided our gold at all at that critical time, either by withdrawing gold from the Bank of England or by purchasing part of the gold which arrived here from outside sources. Moreover, the degree of hoarding of gold during the early stages of the crisis did not reflect itself in large demands for withdrawal of gold from the banks. The public retained in their own hands for some time a large part of the gold already in circulation at the outbreak of war, but with a restoration of confidence this gold gradually found its way into the banks, and thence in due course into the central reserve at the Bank of England. There it has remained ever since, with the exception of the amounts transferred to the United States during the War and since in payment for munitions and of part of our debt to that country.

DROZ, Numa (1844-1899), was born at Chaux-de-Fonds, Switzerland. He was at first apprenticed as an engraver, but he deserted this profession for the career of a teacher. He was for a time professor in the gymnasium at Neuchâtel. In 1864 he founded *Le National Suisse*, a radical newspaper. In 1869 he was elected to the legislature, and two years later became Director of the Department of Public Instruction. He subsequently took charge of the Departments of the Interior (1875), Agriculture and Commerce (1879), and Foreign Affairs (1880). He was several times President of the Federal Council. In 1882 he was one of the negotiators of the Franco-Swiss commercial treaty. He published *Manuel d'instruction civique* (1884); *Cours élémentaire d'instruction civique* (1885). E. L. H.

DUNBAR, Charles Franklin (1830-1900). Born at Abingdon, Pennsylvania. Died at Cambridge, Massachusetts. Graduated from Harvard College in 1851. Engaged for short time in business, then, because of failing health, spent a year in farming. He then studied law and was admitted to the bar in 1858. From 1859 to 1869 he was associate editor of the *Boston Daily Advertiser*, making it one of the leading papers in New England. In 1871 he was made Professor of Political Economy in Harvard University, but spent two years in study and travel in Europe before entering upon the professorship. From 1876 to 1882 he was Dean of Harvard College, and in 1890 became the first Dean of the Faculty of Arts and Sciences, serving in that capacity until 1895. In 1886 he became the first editor of the *Quarterly Journal of Economics*. Professor Dunbar was the second president of the American Economic Association, but never made any presidential address. He wrote comparatively little, the only book from his pen published during his life being *Chapters on the Theory and History of Banking*, 1891, which had been privately printed in 1885. This was an eminently clear and sensible text-book on the subject, which has been so widely used in the American colleges as almost to become a classic. A second edition was published after his death in 1901. A number of miscellaneous articles on banking and public finance were collected into a volume

entitled *Economic Essays*, and edited by O. M. W. Sprague in 1904. Professor Dunbar also published in 1891 a volume entitled *Laws of the United States on Currency, Finance, and Banking*, which was a reprint of the statutes on the subjects, condensing, however, the less important sections. Until the publication by the Government in 1895 and subsequently of all of the laws of the United States relating to loans, paper money, banking, and coinage, this compilation of Professor Dunbar's was much used. E. R. A. S.

ECONOMIC LIBRARIES.

The Goldsmiths' Company's Library, p. 870, Manchester Libraries, p. 872; Foreign Office and other Libraries, p. 873; United States Libraries, p. 873; John Crerar Library, Chicago, p. 874.

THE GOLDSMITHS' COMPANY'S LIBRARY OF ECONOMIC LITERATURE. This is a collection of books and tracts intended to serve as a basis for the study of the industrial, commercial, monetary, and financial history of the United Kingdom, as well as of the gradual development of economic science generally. The first impulse to the making of the collection, which was formed by Professor H. S. Foxwell, came from his predecessor at University College, the late Professor Stanley JEVONS, about 1875, and the first book purchased for it was a copy of Lardner's *Railway Economy*, bought at Mr. Jevons's suggestion from a bookstall—Mr. Jevons observing that this book had led him to begin his famous researches into the mathematical theory of economics.

The collection thus commenced at first aimed at the provision of material for a thoroughly historical edition of the *Wealth of Nations*. Afterwards Arnold TOYNBEE'S special interest in the INDUSTRIAL REVOLUTION (*q.v.*) led to the collection of material for his use covering the period 1760-1860. Later, again, the evils resulting from the demonetisation of silver became marked, and called attention to currency and banking history. The library having thus assumed a general character, efforts were made to make it fairly complete so far as English history was concerned, and in some aspects at least fairly representative of foreign movements. After thirty years of labour the catalogue contains over 30,000 distinct entries, without taking account of a mass of political literature acquired incidentally, and a large collection of original Acts of Parliament of special economic interest. Very much, of course, remains to be done; thirty years more might well be spent on the work. From this account of its origin the stronger points of the collection will be inferred. The history of economic thought is practically complete so far as England is concerned, and very full so far as concerns the French economists before and during the Revolutionary period. No attempt has been made to deal in the same thorough way with the literature of other European countries; but there is a fair collection of works in Italian, Spanish, German, Dutch, etc.; and American economics is well represented.

To come more to detail, the following subjects, among others, will be found fully illustrated: the early history of English Trade, Companies, and Colonies; Mercantilism and Colonial Policy; the Navigation Laws; Guilds and the Towns; Fairs and Markets; Interest and Usury; Early Banking; the history of Agriculture, Enclosures, Commons, Allotments; the rise of foreign trade, especially of the East Indian, and the French and American trades; the Agrarian Revolution of the 18th century; growth of English industries; Machine Industry, the Industrial Revolution, the large towns and their problems; Municipal and Political Reform; Factory Legislation; Trade Unionism; Friendly Societies and Savings Banks; the Co-operative Movement; Education; the condition of the people generally; Socialism in all its forms—Owenism, Chartism, the English socialistic movements generally, indigenous or imported; French, German, and American Socialism; Emigration and Population movements; the history of the Poor Law, and especially of the New Poor Law of 1834; the question of Land Tenure in England, Scotland, and Ireland; Tariff policy in various countries, especially the Anti-Corn Law agitation, the German Zollverein, the protectionist reaction in Europe and America after the Peace of 1815; Financial policy and tax systems: the development of communication, roads, posts, canals, railways, and telegraphs; the growth and changes of Foreign Trade; Competition, its modern developments, abuses, and regulation; the rise of great industrial and commercial combinations; the modern developments of Banking; the history of currency and various currency systems; the history of prices and wages; index numbers; international monetary policy; the great markets for securities and for produce; the history and theory of statistics; the mathematical theory of economics; public control and the economic functions of the State generally; economic criticism and social philosophy. It may be added that those interested in local history will find in the library books or tracts printed in almost every part of the British dominions at home or abroad.

In the selection of literature for the library

the main purpose kept in view has been to make it historical and catholic. No pains or expense have been spared to ensure that, as far as possible, all sides in a controversy should be represented. It therefore differs widely from such a collection as that of M'Culloch, who excluded, with rare exceptions, all books which did not come up to his standard of orthodoxy. The object has been to mirror opinions, not to judge them. If, for instance, the mercantilist view was predominant in the early 18th century, it will be found predominant in the library over that period, and so on. But the dissentient opinions are as faithfully represented as the fashionable ones; no standards have been imposed. If any partiality has been shown, it has been in the desire to put in evidence the scanty and obscure literature which gives a clue to the opinions of the almost inarticulate masses of the people, literature which will probably have for future ages a very special and pathetic interest. Whatever the subject in question, a collection made on these lines would necessarily include a large quantity of tracts and fugitive publications. But in economics, more perhaps than in any other subject, its historical sources are largely of an occasional, non-formal character; and the brief contributions of practical men are often of much greater value than the more systematic disquisitions of professed writers. Hence there is an exceptionally large proportion of pamphlets and tracts in the library, not much less in number than 20,000; among which may be included a large collection of extracts from reviews. The opinions of Dr. Johnson and Macaulay as to the value of such literature are well known. It is to no one of more value than to the historian of economics.

The library also contains a large number of broadsides, many of them from the fine collection of Lord Lauderdale. There are also hundreds of MSS., many of them of great interest, and a large number of autograph letters of economists and statesmen. Among other collections mention may be made of the biographies, the portraits, the prints, some examples of paper moneys, etc.; and the bibliographical collection, which includes a copy of the Catalogue of the Massie Library, the most remarkable collection of English economic literature previously formed.

The main purpose of the library being to facilitate historical research, the contents have in general been arranged chronologically, with subject classification under each year where indicated. But the ordinary forms of catalogue are also in process of preparation. The same arrangement, so far as may be, is observed in the shelving and disposition of the books, but many departures from it have been found necessary. Before 1800 only one general chronological arrangement is adopted for each size—folio, quarto, octavo, and duodecimo; after 1800 special subjects have separate chronological arrangements in special cases. Very long series, and certain classes of books not likely to be so often consulted, will generally be found in the galleries.

Taken as a whole the Goldsmiths' Library is specially remarkable for the condition of its books. Books on Trade, Finance, and Social History, which were not considered to be "literature" by any one before the appearance of the *Wealth of Nations*, nor by most people till a century later, are usually found in bad condition both internally and externally, not having been preserved in good libraries. Those in this collection are for the most part picked copies. Many are presentation copies to the statesmen and magnates whose libraries are referred to below. Many are in sumptuous English and French morocco bindings of the 18th, and in less number of the 17th centuries. The condition of the French 18th century books is particularly fine, most of them being in original extra bindings. Where rebinding was required, the sound general rule has been observed of never binding together what were published separately; and generally everything has been done to facilitate historical and comparative research, which seems the main *raison d'être* of special collections.

The exceptional condition of the books is largely explained, as hinted above, by their *provenance*. Owing to agricultural depression and other well-known causes, the period subsequent to 1875, over which their collection has extended, has been specially remarkable for the number of old and famous libraries brought to the hammer. The following list contains the names of some of those libraries which deserve mention here for the importance of their contributions to this collection:—

The Sunderland, Clandon, Osterley Park, Hamilton Palace, Duke of Sussex, Duke of Cambridge, Duke of Buccleuch, Duke of Portland, Earl of Lauderdale, Stanesby Alchorne, George Chalmers, Gunning, Sir Robert Peel, Lord Monteagle, Agar-Ellis, Lord Prestongrange, Visct. Bruce of Ampthill, Gibson Craig, James Crossley, Frere of Roydon, General Wilson, Gardyne, Lord Ripon, Speaker Onslow, Lord Ashburton, Pleydell Bouverie, Sir John Fenn, Lord St. Leonards, Sir R. C. Hoare, Cornelius Walford, Capelle, Pole-Carew, Trentham; and amongst economists and reformers, Arthur Young, Dean Tucker, Adam Smith, Ricardo, Colquhoun, Cobbett, Francis Place, Quetelet, Joplin, Baring, Senior, William Allen, Oastler, Sadler, Kydd, Lovett, Truelove, Considérant, Paul Janet, Sabatier, Roscher, Col. Hyde, Ruding, Cliffe Leslie, Bonamy Price, Smiles, Hyde Clarke, Gerritsen, etc., not to mention the names of many living donors. Indications of *provenance* have been as far as possible preserved in the books themselves,

and in the shape of book-plates, where it has been necessary to break up the original volumes.

It will be obvious that a library of this kind could not be formed except at a very heavy expense. This expense, always a strain on the modest income of an English professor, became insupportable in view of new demands on that income; and, accordingly, with much regret, arrangements were made to accept an offer of purchase on behalf of a great American library. But the completion of the sale was very generously allowed by the trustees to stand over for six months, ending June 30, 1901, to give opportunity to arrange an English purchase. After various abortive attempts to effect this, the Council of the Royal Economic Society made an appeal to the public in *The Times* of June 25, 1901, supported in a vigorous leader of the same date. Two days later an offer of purchase was received and accepted from the Worshipful Company of Goldsmiths; and the collection was thus retained for the country whose history it had been designed to illustrate.

The Goldsmiths' Company subsequently presented the library to the reconstituted University of London, to be deposited in its central building, now at the Imperial Institute, South Kensington. The existence of this fine library, due to the munificence of the Goldsmiths' Company, is a good example of the manner in which wealthy associations and individuals might promote the advancement of learning and science in this country as in others. The study of the economic progress of different countries under different forms of legislation can hardly be undertaken by individuals without similar assistance. Fresh accessions are continually being made by the generosity of the Goldsmiths' Company, who have also made large gifts for binding and library furniture.

In concluding this notice, it is only the barest justice to mention the very large share taken in the laborious work of compiling, cataloguing, and generally perfecting the collection, by the assistant-librarian of St. John's College, Cambridge, Mr. E. W. Lockhart. Without his very skilled, intelligent, and untiring help, the collection could never have attained its present extent or degree of excellence. His name should always be associated with the Goldsmiths' Economic Library.

All communications respecting the use of the Goldsmiths' Company's Library of Economic Literature must be addressed to the librarian at the University of London. H. S. F.

[Professor Foxwell's dissatisfaction with the arrangements for the maintenance and preservation of the Library led to his resignation from the Committee. He desires it to be made clear that he has no responsibility for, or knowledge of, anything done in connection with the Library since March 25, 1915.]

Economic Literature in the Manchester Libraries. Manchester is unusually well provided with important libraries. Humphrey Chetham, who died 1653, left the bulk of his estate for the foundation of a blue-coat school and public library which now contains 60,000 volumes. Although no special feature has been made of political economy, it contains some of the earlier books, especially of the 18th century, and has a remarkable collection of broadsides presented by J. O. Halliwell-Phillipps, who printed a catalogue of them in 1851. This is merely a numerical list devoid of either alphabetical order or classification. The collection contains much unused material for the history of commerce and industry. The Portico Library and Newsroom, which contains 60,000 vols., is a proprietary institution owned in shares and dates from 1806, and includes some of the modern literature of political economy. A remarkable collection of pamphlets formed by Charles Leigh of Adlington contains many items of interest respecting the affairs of the 18th century. The Athenæum, founded in 1835, largely by Cobden's influence, is essentially modern, and contains 21,000 vols. The largest collection is that of the Free Library, which was the first founded under the Public Libraries Acts, and was opened in September 1852. It consists of a central library and nineteen branches and newsrooms. The Reference Library contains 155,000 vols., and from the beginning special attention has been paid to the collection of material relating to the literature of political economy in its widest sense. A complete set of the *London Gazette* may be named. The collection on trade formed by Nicholas Magens, the banker, at the end of the seventeenth and beginning of the eighteenth centuries was acquired in 1852, with the exception of some Americana, and forms the foundation of one of the largest economical collections in the country. To this have been added the tracts collected by Fullerton of Carstairs, by Sir Edwin Chadwick, and others. In recent years special attention has been given to the literature of municipal institutions, but the collection is also rich in material for the history of trade, the organisation of labour, and the fiscal controversy. The librarians from the commencement have paid special attention to the collection of pamphlets, and this has been facilitated by the fact that Manchester has been a centre of the active discussion of economic problems. The library of the Manchester Statistical Society, the oldest in the kingdom, now forms part of the city library, which has also absorbed the foreign library. The collection of parliamentary papers and official publications is large, and foreign and colonial documents have been freely added. Another strong point is the extensive series of periodical publications in long sets, including, for instance, the *Journal des Économistes*. This feature is also seen in

the library of the Manchester Literary and Philosophical Society, which was founded in 1781, and, chiefly by exchange of publications, has formed a library which contains the issues of the most important academies and learned societies of the world. It contains 29,700 vols. in a house which dates from the early years of the 19th century, and has memories of Thomas Percival, John Dalton, and other famous men. The Law Library, whilst formed only for professional purposes, contains 12,000 vols., including some books which are of importance for the history of certain branches of economics. The University of Manchester has developed from the college founded under the will of John Owens, a wealthy merchant, who died in 1846. The library now contains 100,000 vols. and includes the important collection made by William Stanley Jevons, who held the chair of Political Economy in Owens College before his removal to London. His books extend to 2394 volumes, and form about one-half of the University's economic section. In connection with the Faculty of Medicine there is the library of the Medical Society (established 1834) extending to 32,000 vols., and containing many books, some of great rarity, dealing with topics common to medical and economic science. The latest addition to the literary institutions of Manchester is the John Rylands Library, founded in 1899 by Mrs. Enriqueta Rylands in memory of her husband, who was one of the merchant princes of the city. It contains 110,000 volumes, and by the purchase of the Althorp Library it has become one of the greatest storehouses of early printed books and of the Italian literature of the Renascence—departments in which the student of economics may find some fresh fields of research.

Although there is no organic connection between the various Manchester libraries, except that the Medical Library is housed in the University, there is much unofficial co-operation, so that any one engaged in serious research will easily be guided, when necessary, from any one institution to all the others. W.E.A.A.

The Foreign Office is in possession of a very interesting Library containing a considerable number of works of reference dealing to a large extent with the Colonies, and also with the condition of other countries of the world, as existing in the first half of the 19th century and down to a somewhat later date. A very complete index was added by Mr. W. M. Bucknall at the time he was the librarian.

This Library was formed by the Board of Trade before the year 1866. It would be a useful thing if it were returned to the office where it was originated and brought up to date, and we are glad to record that a suggestion to this effect has recently been made. Many of the works it contains are rather rare. The Royal Statistical Society and the London School of Economics and Political Science both possess valuable collections of economic works.

United States. The most important libraries bearing on economics in the United States besides the Crerar and Newberry Libraries in Chicago are as follows:—

1. The New York Public Library on the Astor, Tilden, and Lenox Foundation (librarian, Dr. John S. Billings) is believed to have the best collection of economics of any public library in the world outside the British Museum. This is certainly true of American economics.

2. The Congressional Library at Washington, which has added immense stores in recent years.

3. Of the university libraries; among these the most important in economics are, in order mentioned, Columbia, Harvard, and on a level Yale, Johns Hopkins, and Chicago.

4. The University of Pennsylvania has the old collection of Carey and Baird, which is strong in eighteenth-century English literature. (See H. C. Carey.)

5. The Boston Public Library is a very fine one.

6. The Wisconsin Historical Society Library is also very strong.

7. Of private libraries, that of Professor Seligman of Columbia University contains about thirty thousand volumes and many pamphlets on economics. The mediaeval literature is well represented, and there are a fairly large number of incunabula. The library is strong in the early English literature of the sixteenth, seventeenth, and eighteenth centuries, containing not a few items that are not represented either in the Goldsmiths' collection or in the British Museum. Special features are the broadsides relating to the chief economic topics of the early period as well as a rich collection of Irish items. The foreign literature, especially early Spanish and Italian, as well as the German Cameralists and the French Physiocrats, is very completely represented. Professor Seligman has devoted particular attention to the British literature of money, public finance, and labour. In the latter field the library includes half of the Francis Place collection, the other half being in the British Museum. It is also rich in the periodical literature of labour and Chartism, containing a number of titles not found in Foxwell's bibliography. Attention might also be called to the rich collection of early railway literature. French and German socialism is well represented with almost complete collections of the original editions of St. Simon, Fourier, Cabet, and the like.

This library is said to have a more complete collection of the German socialists, including Marx, Rodbertus, and Lassalle, than is to be found in any German library, with a great mass of pamphlets on the finances of the French

Revolution and on the socialistic movements in France, especially 1830 and 1848.

The most striking feature of the library, however, consists in the eighteenth-century Americana. It is especially strong in the early monetary literature and in the revolutionary and post-revolutionary writings. As regards the first half of the nineteenth century, especial attention might be called to the labour and socialist periodicals, as well as to the rarer pamphlets on American finance, protection, and transportation.

Attention might also be directed to the fact that with few exceptions all volumes of pamphlets have been broken up and separately bound. All publications before 1800 which are not found in the contemporary binding have been rebound, chiefly by Riviere, in full or half levant, so that the library is in exceptionally good condition.

As regards English literature, it has every work mentioned in M'Culloch's bibliography, and many items which he does not mention.

JOHN CRERAR LIBRARY, THE, CHICAGO. The John Crerar Library, the latest established of the free public libraries of Chicago, owes its existence to the bequest of the late John Crerar, for many years a prominent merchant of the city. The endowment realised from this bequest is conservatively estimated at $3,400,000 (say £680,000), producing an annual income of over $160,000 (say £32,000).

The library was incorporated 12th October 1894, organised 12th January 1895, and opened to the public 1st April 1897. Its character and scope as a free public reference library of scientific literature were determined by the directors from their personal knowledge of the views and wishes of the founder, and after consultation with the governing boards of the other public libraries of the city.

Its field may be defined as that of the natural, physical, and social sciences, and their applications. In view of Mr. Crerar's desire that the books and periodicals might be "selected with a view to create and sustain a healthy moral and Christian sentiment in the community," the directors have always regarded the social sciences as one of the most important portions of this field. For convenience in dealing with appropriations, statistics, etc., the books are divided into six departments: general works, social sciences, physical sciences, natural sciences, medical sciences, and applied sciences.

On 1st January 1907 the department of social sciences had the largest number of volumes, in round numbers, 55,000 out of a total of 200,000; the second largest number of pamphlets, 20,000 out of 65,000; and received currently the second largest number of periodicals, 500 out of 2500.

The department of social sciences has eleven divisions: general works (including sociology), ethics, religion, statistics, political science, political economy, law, administration (including public documents), charities and correction, education, commerce and communication, manners and customs (including folk-lore and the woman question). Of these the most important is political economy, with about 16,000 volumes and 12,000 pamphlets. Then follow administration and documents, 14,000 volumes and 1000 pamphlets; general works, 6500 volumes; education, 5000 volumes; and manners and customs, 3500 volumes and 3000 pamphlets. While commerce and communication as a division of the social sciences is credited with only 2500 volumes, it might be said that if the works dealing with the technical and administrative sides of the subject were included, the number would be more than doubled.

It has been the purpose of the directors to develop the Library symmetrically, and by the addition of the latest works and the completion of the files of periodicals, rather than by purchases *en bloc*. Nevertheless they have not hesitated to take advantage of exceptional opportunities. Thus they were ready to purchase the collection of Prof. H. S. Foxwell on economic history (see p. 870), had it not been kept in England. Of these special acquisitions the largest and most important, except the transfer of the medical department of the Newberry Library, is that of the private library of the late Mr. C. V. Gerritsen, of Amsterdam. It consisted of some 18,000 volumes and 15,000 pamphlets on social and economic subjects, being especially full on finance, banking, labour, and socialism. It included a collection, formed by Mrs. Gerritsen (Dr. Aletta H. Jacobs), of nearly 6000 volumes and pamphlets on the social, political, and legal status of woman. A printed catalogue of this part of the library, complete to 1900, was exhibited at the Paris Exposition of that year, under the title of *La femme et le féminisme*, and received a diploma of honour.

The private library of Professor R. T. Ely, of the University of Wisconsin, was acquired in 1902. It covered the whole of political economy, but was especially strong in works dealing with American labour and social movements. It consisted of some 6000 volumes (600 of which were bound volumes of labour periodicals) and 4000 pamphlets.

The income of a bequest from its second president, the late Huntington Wolcott Jackson, is applied to the formation of a collection on constitutional law. The total number of volumes in this collection is now about 350.

In public documents the Library is rather stronger than might be expected, considering the short time it has been established. It is a "designated depository" of the Congressional documents, a special depository of the Congressional documents, a special depository of the publications of the U.S. Geological Survey,

and one of three depositories of all bills, resolves, and acts of Congress since 1901. Many state and some city documents have been acquired. Of foreign documents it has all the parliamentary papers of Great Britain since 1896, and most of the earlier ones on economic subjects; a nearly complete set of the parliamentary papers of Canada; a very full set of those of the Netherlands; a good set of those of Sweden; an unusual collection of French documents of the 15th to the 18th centuries on economic subjects; many serial official publications of Austria, France, and Germany; and a noteworthy collection of Australian documents dealing with the labour question, presented by the late Henry D. Lloyd.

In periodical literature also the Library is stronger than might be expected. Many of the 500 periodicals on the Social Sciences which are currently received are represented by complete sets, and in addition the 8000 volumes of periodicals and society transactions classed as general works offer much to the student of the social sciences. The publications of over one hundred such societies are currently received, and complete or nearly complete sets are available of about half of them.

As the public libraries of the city have adopted the policy of avoiding unnecessary duplication, a union list of the serials in them was thought to be desirable. In 1901 the Chicago Library Club issued such a list, and the John Crerar Library has issued a supplement, the second edition of which appeared in 1906. The original list and the supplement give the location of 12,000 serials in nineteen libraries.

One other of the publications of the Library is of some general interest. The list of Bibliographies of Special Subjects gives not only the distinctly bibliographical works on each subject, but also the works which contain bibliographical material thought to be of value. The arrangement is systematic, and there are about 400 entries on the social sciences. C. W. A.

ECONOMICS, TEACHING OF.

General, p. 875; Cambridge (Economics Tripos), p. 877; Oxford, p. 879; United States, p. 881.

GENERAL. It is the main purpose of this article to describe the position of economics in the various universities other than Oxford and Cambridge, university colleges, and similar institutions in the United Kingdom. In the University of London Political Economy may be taken for the B.A., and there is an economic group for the M.A. There is also in the university a Faculty of Economics and Political Science (including Commerce and Industry), in which the degrees of B.Sc. and D.Sc. are granted. For the former candidates may present themselves for a pass or for honours. A more definitely commercial variant of the B.Sc. is at present under discussion by the university. Teaching in economics for the degrees of the University of London is provided in several institutions, of which special mention may be made of the London School of Economics (Clare Market), University College, King's College, and the Birkbeck Institute. The School of Economics was founded in 1895. In economic subjects its "appointed teachers in the University of London" number five, who deal respectively with Economic Theory, Statistics, Banking and Currency, Economic History, and Foreign Trade. There are other "appointed teachers" on such allied subjects as Economic Geography, and many lecturers in addition on general and special subjects. Instruction is given both in the day and in the evening. University College includes a professor (the chair was established in 1828, M'CULLOCH being the first occupant), an assistant professor, a lecturer on Statistics, and a lecturer on Commercial Methods. In addition the professor of Mathematics holds a statistical honours class. King's College has also a professor whose chair was not established until 1859, though lectures had been given for some time previously. At the Birkbeck Institute the present principal has taught economics for a quarter of a century. He is now assisted by a lecturer.

Closely related in design to the Faculty of Economics in the University of London (the first degree of which is B.Sc.) are the Faculties of Commerce of the University of Birmingham, of Manchester, and of Leeds (the first degrees of which are B.Com.). The first was founded in 1901, and the second and third at intervals of two years. At Birmingham the economic teaching is in the hands of a professor of Commerce (chair established 1901), and another of Finance, whose lectureship, created in 1902, was transformed into a chair in 1906. The course extends over three years, and can be taken only by day students. The same holds at Leeds, where the economic instruction is imparted entirely by one professor whose office was created in 1903. At Manchester, where attendances for three years are required in ordinary circumstances, and for four years when attendances cover less than seven hours a week, lectures held in the evening as well as those held in the day are recognised for the degree in Commerce. As in London, full courses of lectures are provided both in the day and evening. A professor of Political Economy and a lecturer on Economic History (first appointed in 1903), who assists also in other economic teaching, are responsible for the bulk of the instruction in Economics provided at Manchester, apart from Economic Geography, which is the subject of a distinct lectureship. The teaching of Economics at Manchester extends backwards for nearly half a century. Usually it was united with other subjects, but some years ago a distinct lectureship was instituted,

and in 1901 the lectureship was transformed into a chair. In this university and at Birmingham and Leeds economic subjects figure in another faculty or other faculties than that of Commerce. At Manchester honours may be taken in the Faculty of Arts in Economic and Political Science, as they may also at Liverpool. At Liverpool a professorship, created out of an earlier lectureship in 1891, and a lectureship, added in 1907, exist in Political Economy, in addition to a lectureship on Geography. A School of Commerce, the course in which does not lead to a degree, is slightly connected with the Liverpool university, and in this school lectures are given on commercial methods as well as upon other subjects. A proposal to institute a degree in Commerce is now under consideration. At the University of Sheffield Economics and Mental and Moral Science constitute the domain of a lectureship created in 1897. The subject has a place in the curriculum for graduation. In the University of Durham Political Economy is a voluntary subject for the B.A. and B.Litt. Two persons are engaged in the teaching, but only two courses are offered.

In addition to the universities some mention should be made of the university colleges and institutions of similar standing in England. Of University College, Bristol, Professor Marshall (professor of Political Economy at Cambridge) was the first principal, but after his retirement economics did not occupy a large place in the teaching of the college, until in 1901 a chair of Economics and Public Administration was created. There is, in addition, a lecturer in Economics, who has been holding small classes for some years, and doing the limited amount of work required until lately. In connection with the scheme for a University at Bristol, it is proposed to establish a degree in Public Administration and Economics or in "Commerce." At University College, Reading, the Professor of Mathematics and Economics (whose chair was created in 1907 out of a lectureship) devotes a limited amount of time to imparting economics for the commercial diploma granted by the college and for the London B.A. Courses in Economics are offered by the professors of History at the Royal Albert Memorial College, Exeter, and Hartley University College, Southampton, but practically no advantage is taken of them. At University College, Nottingham, an evening course is delivered by the professor of History. At Armstrong College, Newcastle-upon-Tyne, the lecturer on Philosophy used to be required to teach Economics also, but no lectures were given, and there is no provision of economic teaching to-day.

In all the universities of Scotland Political Economy may be taken as one of the subjects for the M.A. The group of honours known as Economic Science means Political Economy with either (*a*) Moral Philosophy, or (*b*) one of the history subjects of the honours standard, as supplementary subjects. At Aberdeen there is a lectureship in Economics established in 1905. At Edinburgh, where the staff is now one professor, whose chair dates back to 1871, and one assistant, made also lecturer on Economic History in 1904, the Court has decided to institute full courses in Economic History, qualifying for both the ordinary and honours degrees. When this is done, honours in Economic Science may be based entirely on a knowledge of economics. At Glasgow there is one professor (a lectureship founded in 1892 being replaced by a chair in 1896) who hitherto has engaged an assistant or assistants, and Economic History is taught, and work is done for both pass and honours. At St. Andrews one lecturer (the post was created in 1889) imparts all the instruction for pass and honours. University College, Dundee, now part of the University of St. Andrews, offers no economic teaching, though it did in the sessions 1885-87, when successful classes were held under the present professor at Glasgow. Usually in the Scottish universities, before the institution of separate posts, lectures on Political Economy were delivered by professors of allied subjects which sometimes were understood to include it.

The University of Wales comprises three constituent colleges, viz., Bangor, Aberystwyth, and Cardiff, and in the last two of these Economics is taught for graduation,—at Cardiff by an associate professor (work was begun by a lecturer in 1899), who devotes the whole of his time to Economic and Political Science, and at Aberystwyth by a lecturer who unites with this work some teaching in Philosophy. Political Economy may be taken as an intermediate subject and with Political Science for honours. At Bangor all that is attempted at present is an annual course of six lectures, on the George Rae foundation, on "Some aspects of Political Economy, with special reference to Banking."

As regards Ireland, Trinity College, Dublin, has enjoyed a professorship since 1832, in which year a chair was founded by Archbishop Whately, the occupant of which also teaches Commercial Law. Students are prepared in Political Economy for the examinations, pass and honours, of the Royal University of Ireland at the Queen's Colleges of Belfast and Cork. At the former there is one professor who also teaches Jurisprudence, and at the latter a professor of Mental and Social Science who delivers lectures on Political Economy.

From the above sketch it is evident that provision of instruction in Economics in the United Kingdom has received a distinct stimulus in the last dozen years, but the amount of work done, in respect both of the number of teachers of the subject and of the number of

students, is still far inferior to that done in Germany and the United States. In Germany Economics figures in all the universities, and plays a leading part in some, and there are, in addition, four higher commercial schools, the kernel of the courses in which is economic. In the United States (see ECONOMIC TEACHING IN THE UNITED STATES) there are some specialised higher commercial schools, and in the departments of Economics of some of the most prominent universities, large staffs of teachers and crowds of students are to be found. In France the teaching of Economics is in a peculiar position. As it has recently received a place in the curriculum of the Faculty of Law the amount of work done is considerable, but in the Faculty of Law it is practically confined to preparation for prescribed examinations of a somewhat limited scope, and inasmuch as all teachers in this Faculty must be doctors of law, it tends at present to border upon Jurisprudence. Outside the Faculty of Law there are in France few teachers and few students. S. J. C.

[Since the above was written, degrees in Commerce have been instituted in the University of London. The London School of Economics has developed into the most completely organised centre of economic teaching in the Empire. Mention should also be made of the Newmarch Lectures and the Jevons Memorial Lectures delivered annually at University College, London. The Professorship of Economics in the University of Liverpool, vacated by the death of Professor GONNER in 1922, has not been filled, and will, it is understood, be kept in abeyance for a few years.]

ECONOMICS TRIPOS, CAMBRIDGE. The Tripos in Economics and associated branches of Political Science was instituted by the University of Cambridge in 1903 in order to give encouragement to an important form of liberal education, and at the same time to make special provision for students who are proposing to devote their lives to the professional study of Economics, and for those who are looking forward to a career in the higher branches of business or in public life. And a curriculum of education, which is fairly complete so far as the main requirements go, was set up soon after. There are, however, several gaps which could be advantageously filled, if adequate funds were forthcoming.

No attempt is made to fill the mind of the student with a mass of technical information connected with the particular branch of business in which he is to be engaged. Such instruction may perhaps suitably be given in commercial schools to lads who are expecting to begin to earn their livelihood at an early age; and it may be given to even better purpose in the evening classes of universities and colleges in great industrial centres, for the benefit of those already engaged in business. Cambridge is not well placed for this work. But she has exceptional facilities for strengthening and developing the mental and social faculties of those who in after-life will bear the higher responsibilities of business, and who are prepared to work hard. The curriculum aims rather at giving an education which will enable men in the higher posts of business and of the public service to meet the ever-increasing demands on their intelligence and power of going to the root of difficult questions. For while there is in some directions a tendency towards increased specialisation in the work of subordinates; there is an even more marked tendency towards greater breadth and diminished specialisation in the work of those who are responsible for the main decisions in the conduct of large affairs.

So much is this the case that a man may be more fitly equipped to be a leader in business by an education which has braced his mind to hard work in subjects that have no connection with it, than if he had occupied himself with an enervating form of technical instruction, however directly that might bear on his after-work. But, provided the studies be themselves of a truly liberal character, the closer their bearing on his after-work, the more active is his interest in them likely to be during his stay at a university and in after-life. To a colliery manager who has made a thorough study of geology the shafts and galleries of a mine are a scientific museum and laboratory: his mind grows with his work, and he may increase the world's wealth of knowledge. But if the same man had neglected geology, and pursued other studies at a university, his B.A. degree would not improbably have been the end, instead of the starting-point, of the chief intellectual work and interests of his life. As geology is related to mining, so is economics to general business.

But in addition to a strong and alert mental faculty, the business man needs to have acquired a knowledge of human nature, together with the power of managing men, and to this end the social training afforded by life in a residentiary university of the Anglo-Saxon type is specially serviceable. For such a life draws out the faculties which are needed in the social relations of those who have to deal with large bodies of men and large public interests. On the river and in the football field the student learns to bear and forbear, to obey and to command. Constant discussion sharpens his wits; it makes him ready and resourceful; it helps him to enter into the points of view of others, and to explain his own; and it trains his sense of proportion as regards things and movements and persons, and especially as regards himself.

In short, the curriculum claims to give a liberal education; *i.e.* one which in the late Sir Richard Jebb's words "trains the intel-

ligence, gives elasticity to the faculties of the mind, humanises the character; and forms, not merely an expert, but an efficient man"; while none the less it is a practical education for large affairs.

With these aims in view, the study of economics is supplemented by a compulsory study of the recent economic and general history of the chief countries of the western world; by a study partly compulsory and partly optional of the elements of political science; and by an optional study of Civil Law as applied to economic questions, and of International Law.

The distinctive feature of this scheme is the prominence given to recent international history. If the study of history is to be international, time cannot be found during the short three years of undergraduate life for carrying it further back than the beginning of the 19th century; though some general knowledge of the antecedents of that century is included. Of course there are some students of economics for whom the earlier centuries of English history have a special attraction; and provision is made for this important class of students by their liberty to substitute one part of the Historical Tripos, in which prominence is given to this subject, for one of the parts of the Economics Tripos. For each of these Triposes is divided into two parts, the first of which is taken, under ordinary conditions, at the end of the second year.

The chief reason for giving this prominence to international studies is the belief that the exceptional insularity of the thought and studies of Englishmen is prejudicial to the best interests of the nation both intellectual and material. Especially is the notion that England may be contented to study economics simply from her own point of view passing away. It is admitted that some generations ago, when she was favoured by exceptional advantages, and was far in advance of other countries, she could afford almost to neglect their experience without much loss. But it is seen that the habit of depending solely on her own resources, which she thus acquired, continued after it had lost all justification; and, that as meanwhile all other progressive countries were giving much of their energies to learning from her and to learning from one another, she has been grievously handicapped in the race. Suddenly she has awakened to the fact that others, with certainly not greater natural vigour, have so profited by world experience as to advance faster than she has done in many directions, and to reach beyond her in a few. The studies encouraged by the Economics Tripos will help to free England from this great reproach.

The following is the schedule of the examination; the subjects marked with an asterisk are compulsory. In Part II. the student must take not less than two and not more than five papers besides those which are compulsory:—

Part I.

1. Subjects for an Essay. One paper.*
2. The existing British Constitution. One paper.*
3. Recent Economic and General History. Two papers.*
4. General Principles of Economics. Three papers.*

Part II.

1. Subjects for an Essay. One paper.*
2. General Economics. Three papers.*
3. Advanced Economics, mainly realistic. Two papers.
4. Advanced Economics, mainly analytic. Two papers.
5. Modern Political Theories. One paper.
6. International Law with reference to existing political conditions. One paper.
7. International Law with reference to existing economic conditions. One paper.
8. Principles of Law as applied to economic questions. Two papers.
9. Special subject or subjects. One paper each.

Some of the papers in each part include quotations from French and German writers. The Examiners have regard to the style and method of the answers.

The following are some details relating to Part I.:—

The paper on the existing British Constitution deals with the main outlines of the existing political and administrative organisation (central and local) of the United Kingdom, and with the government of colonies and dependencies, comparatively treated.

The questions on Recent Economic History deal chiefly with the United Kingdom and with the 19th century. They also take special account of other English-speaking peoples, and of France and Germany, during that period. Some knowledge of physical geography in relation to recent economic development is required.

The questions on Recent General History deal with the British Empire, Continental Europe, and the United States, and chiefly with the 19th century. They do not include military or literary history. Some knowledge of political geography is required.

The following are some details relating to Part II.:—

In Part II. an attempt is made to introduce into the Tripos system some of that elasticity and freedom of choice for each individual student which in some other Universities is obtained by a *viva voce* examination directed specially to branches of study which the candidate has selected for himself; his choice being, of course, subject to the condition that

they shall be sufficiently broad, and yet have a certain unity.

The main purpose of the three compulsory papers on General Economics is to secure that those who take Part II. of this Tripos after another Tripos (or a part of it), should have a sound knowledge of the main principles of Economics at large; and that those who have already taken Part I. of this Tripos should not specialise even their later studies too narrowly. In addition, these papers are to lay stress on Public Finance, the Economic Functions of Government, and the ethical aspects of Economics generally; some discussion of socialism being included under this head; since all these matters are more appropriate to the later than to the earlier years of a student's career. But that work in Economics which is most distinctive of Part II. must necessarily be directed into rather narrower channels; for no one can do really advanced work over the whole field. And here a double bifurcation is required.

The first bifurcation has reference to the divergent needs of active life and of professional study. Those who are preparing for public or private business must in their third year give their chief attention to realistic work, to the facts of business life, and to the direct application of economic principles to them. Accordingly two papers, arranged specially for this class of students, are mainly realistic. Two similar papers are of a more exclusively academic character, and make provision (*a*) for some of the more obscure problems of value, such as those connected with the shifting and ultimate incidence of the burden of taxes; (*b*) for the history of Economic doctrines; and (*c*) for mathematical problems in Economics and Statistics. These papers are optional, but there is nothing to prevent any student from taking all of them.

The second bifurcation has reference to the different groups of subjects which are included under the broad title "Economics." They are all intimately connected with one another. There is scarcely any of these which can be studied at all thoroughly without some considerable knowledge of almost every other. But yet each professional student according to his bent of mind, and each man of affairs according to his work in life, will wish to give his chief attention to certain branches; and accordingly while each of the four papers on Advanced Economics contains some general questions, the majority of the questions in each paper are divided in about equal proportions among the four groups:—A, *Structure and Problems of Modern Industry;* B, *Wages and Conditions of Employment;* C, *Money, Credit, and Prices;* D, *International Trade and its Policy.*

A and B will be of special interest to those who expect to be employers of labour, or landowners, or to be engaged in the service of railways, or in the administration of government, central or local. C and D, together with the latter part of A, will meet the needs of those who are to be engaged in large financial transactions, as bankers, members of the stock exchange, etc.; while merchants and those members of manufacturing firms who are chiefly responsible for the external relations of the business rather than its internal organisation, will perhaps give their chief attention to D and part of either C or A. Those who expect to be engaged in the service of the poor will give the first place to B. The studies of any one who hopes to take part in legislation need to be broad; but he may reasonably specialise to some extent on one, or even two of the four.

The remaining subjects in Part II. lie outside the range of Economics, but are closely connected with it. They are all optional. Modern Political Theories will attract these who are likely to hold responsible political positions at home and abroad. The combination of economics, recent history, and political science with international law affords an introduction to the diplomatic and consular services. And lastly the fusion of economic and legal studies, which has given good results in Germany, the United States, and other countries, may perhaps be promoted by the optional papers on the Principles of Law.

Instruction in some of the subjects is given for the present not in lecture, but by personal guidance and advice as to reading. A. M.

Since the foundation of the Economics Tripos in 1903, the number of students taking it has grown very greatly. The teaching staff has expanded correspondingly, and there are now, in addition to the Professorship of Political Economy, three University Lectureships in Economics and one in Statistics. The number of college teachers has also grown. In the light of experience the detail of the curriculum has been modified from time to time. At present Part I. of the Tripos is devoted to general economics and to recent economic and general history; and in Part II., while all candidates are required to take one paper on economic principles, and one on public finance, it is open to them to devote the main part of their time *either* to more advanced work in economics *or* to political science, international relations, and international law. Provision was made for bifurcation in these two directions in the original plan of the Tripos, but recently the dividing line has been drawn more sharply.

A. C. P.

Economics, Teaching at Oxford. The subject presents the following questions: To what ends is the teaching of Economics at Oxford directed? by whom is it given? to whom, and in what manner?

1. Success at examinations is for the most part the object directly aimed at. Doubtless

there is an admixture of higher motives, and learning is not courted only for the sake of her dower. The examinations for which preparation is made are either instituted by the University or are external. The examinations at Oxford into which Economics enter pertain to the Final Honour school of Literæ Humaniores, the Honour school of Modern History, the Final Pass school, and the diploma in Economics. Candidates for Honours in Literæ Humaniores are examined, *inter alia*, in "the outlines of Political Economy." Out of some twelve papers one or two questions on one paper may bear directly on Economics. Those who have been taught to admire the Greek ideal of demonstrative knowledge are not encouraged to study the one department of Social Science in which deductive reasoning is practised with success. This deficiency is partly compensated by the permission which is given to candidates to offer "Political Economy with special study of two or more treatises" as an additional "special" subject. According to the statutes "in the arrangement of Honours great weight will be attached to excellence in a special subject." In spite of this assurance very few candidates for Honours in this school offer Political Economy as a special subject.

In the Honour school of Modern History a paper is set on "Political Economy with Economic History." But "candidates who do not aim at a place in the first or second class" may omit either this subject or Political Science. Additional weight accrues to Political Economy in this school when it is taken up as a "special subject." The curriculum for Political Economy as a special subject prescribes the study of two main topics—to give an example, International Trade and Public Finance have been chosen—partly in general treatises, partly by means of historical documents. For instance, under the head of Public Finance there are prescribed Bastable's treatise on the subject and a part of Wagner's *Finanzwissenschaft*, together with several parliamentary reports and speeches which throw light on the history of English finance from the beginning of the Napoleonic wars to the end of the 19th century. This curriculum may appear somewhat discontinuous; but it would be difficult otherwise to comply with the condition imposed on a "special subject," that it should be "studied with reference to original authorities."

The "Elements of Political Economy," taken along with certain other subjects, forms one of the avenues by which the student who does not aspire to Honours may *pass* to the degree of B.A. Candidates are examined in Walker's *Political Economy*, and selected portions—nearly twenty chapters—of Adam Smith's *Wealth of Nations*. They are also "expected to show an acquaintance with the chief facts of the economic condition of England at the present time."

For the diploma in Economics there is an examination at which five papers are set to each candidate,—two in Economic Theory, one in Economic History, and two in special subjects which the candidate selects out of three groups of special subjects, viz.: A. Either (1) some special branch of economic theory, or (2) some particular school of economic thought, or (3) the treatise of some leading economist, *e.g.* (*a*) the theory of rent, or (*b*) the Austrian economists, or (*c*) Ricardo's *Principles* (fifteen possibilities are enumerated). B. On some special period of economic history (*e.g.* the Industrial Revolution). C. Some special branch of applied economics (*e.g.* the statistical measurement of changes in prices). The number of pairs that can be made out of the alternatives specified in the published list amounts to 231; and candidates are not restricted to selection from the list. They have also the option of offering a dissertation in lieu of a special subject.

The principal external examination to which the efforts of economic students at Oxford are directed is that which constitutes the open competition for the Civil Service of India, clerkships (Class I.) in the Home Civil Service, and Eastern cadetships. Candidates are expected to possess a knowledge of economic theory as treated in the larger text-books, also a knowledge of the existing economic conditions and of statistical methods as applied to economic inquiries, together with a general knowledge of the history of industry, land tenure, and economic legislation in the United Kingdom.

Success in an examination is not the only tangible result at which students may aim. There is the Cobden prize for the best essay on a subject set every four years; there are the degrees of Bachelor of Literature and Bachelor of Science, which may be won by economic as well as other kinds of research.

2. The subdivision of the second head follows that of the first; so far as the *raison d'être* of the teachers is the preparation for examinations. Of the numerous courses organised by the Faculty of Literæ Humaniores one may occasionally relate to an economic subject. For instance, there was announced for the Hilary Term 1907 "Informal Instruction in the Relation of Economics and Ethics (Problem of Collective Bargaining)." The Faculty of Modern History gives more prominence to Political Economy. One or more of the ablest historical tutors usually deliver a course of lectures on Political Economy. A larger number of teachers, six or seven at a time, are told off to assist candidates for the Final Pass school. In all these cases the teacher is usually a tutor in, or otherwise intimately connected with a particular college; but the benefit of his teaching is extended to members of other colleges by a kind of intercollegiate exchange which is not without economic interest. The diploma in

Economics also calls forth teachers, some addressing themselves to the general part of the examination, some to the special subjects.

This classification of teachers does not comprehend the professor of Political Economy who is not tied down to any particular course. But he must not reckon upon an audience if he ignores the motive by which students are mainly attracted to lectures. The present professor usually lectures on one or two of the subjects prescribed for some of the examinations which have been mentioned, as well as in other subjects adapted to the needs both of those who are preparing for examinations and those who aim at higher objects. That there should be only one professorial teacher of so important a subject as Political Economy in so large a university as Oxford is an anomaly which has at length been mitigated by the creation of a lectureship in Economic History, the first holder being Mr. L. L. Price of Oriel College. The subject is also taught by many private teachers.

3. The persons taught at Oxford are mostly undergraduates, destined in due time to take the degree of B.A. by way of a Pass or an Honour examination. But to this general statement there are important exceptions. The Rhodes scholars are undergraduates *sui generis*; some of whom can only spend a year or two at Oxford, and so cannot take a regular degree—but at most a diploma. The diploma in Economics is open to students who are not members of the university, provided that they have pursued an approved course of study at Oxford. Also, men who have qualified themselves for the degree of B.A. by taking Honours in Literæ Humaniores may afterwards read for Honours in Modern History. Men who have taken Honours in either of these schools may afterwards read for the diploma in Economics. Women may undergo all the Oxford examinations which have been mentioned. In the case of the diploma they receive the same recognition as the men. In the case of the Honours Schools they are arranged in classes like the men. They are now (1924) admitted to all but Divinity degrees on the same terms as men. Among exceptional classes of students should be mentioned visitors from other academic worlds who occasionally attend the lectures of the professor. Mention may also be made of the students at Ruskin College, at present numbering fifty or sixty. They are usually members of the working class, often selected as men of mark by trade unions.

4. The commonest method of teaching is the lecture. Lectures are not usually interrupted by questions and answers. The advantages of dialectic, considerable in the case of economics, may be obtained by the "informal instruction" which often supplements lecturing. The teacher usually has read to him by the pupil—sometimes himself reads—an essay written on a subject of the kind set in the schools. The teacher then comments on the paper, correcting the form and adding to the matter. Sometimes two men with two papers will attend simultaneously, or a larger number may assemble for the discussion of a paper read by one of them, after the manner of a seminar. Doubtless it is a great advantage to a student to obtain for an hour, or even a shorter period, the full attention of a first-rate teacher. On the other hand, numbers have a certain stimulating effect. Moreover, the distribution of knowledge on a large scale economises the labour of the teacher. The Modern History tutors discharge many of the functions which in foreign universities devolve upon professors. To impose exhausting work on these tutors is to diminish the efficiency of economic teaching at Oxford.

F. Y. E.

[The most important change in the regulations relating to the study of Economics at Oxford which has occurred since the date of the preceding article, is the institution of the Honour School of Philosophy, Politics, and Economics. The subject to be studied is described as "the structure and the philosophical, political, and economic principles of Modern Society." The examination is so arranged that candidates may give special attention to any one of the three subjects of this group.

Those who specialise for Economics will be expected to show a knowledge of economic theory and of its history and its application. They will be examined in certain prescribed books and a so-called "further subject." The prescribed books are Adam Smith's *Wealth of Nations*, the Works of Ricardo, Marx's *Capital*, Vol. I., Jevons' *Theory of Political Economy*; List, the *National System of Political Economy*.

The "further subject" is one of the following: Currency and Banking, Capital and Labour, Labour Movements from 1815 to 1875. The results of the first examination which has been held are reported to be encouraging.

The Diploma in Economics, described in the above article, has been transformed into the Diploma in Economics and Political Science, with corresponding changes in the curriculum.]

F. Y. E.

Economic Teaching in the United States. The teaching of economics as a university discipline is essentially a modern development. The first professorship of the subject was at Columbia College, New York, where John M'Vickar was made professor of Moral Philosophy and Political Economy in 1819. The second professorship was at South Carolina College, Columbia, South Carolina, where Thomas Cooper, professor of Chemistry, had the subject of Political Economy added to the title of the chair in 1826. The first professorship of Political Economy was established at Harvard College in 1871, and at Yale College in 1872, although the subject had

been taught at Harvard by Francis Bowen since 1853.

Comparatively little attention was paid to economic questions apart from the problems of currency and free trade until after the civil war (1861-65). The new economic problems which forced themselves upon the attention of the country after the crisis of 1873 led to the migration of a number of young men to Germany to study economics. With their return in the years 1878-85, rapid additions were made to the body of instructors in the larger institutions, and a number of new chairs were created. Since then the interest in economics has spread throughout the length and breadth of the land, until at the present time most of the several hundred colleges in the United States afford instruction in the subject, while the larger institutions have a staff of instructors devoted to it. At institutions like Columbia, Harvard, Yale, Chicago, and Wisconsin, there are from ten to twenty professors of Economics and Social Science, together with a corps of lecturers, instructors, and tutors.

The character of the instruction in economics in the United States varies largely with the institution. In the smaller colleges the courses are confined to one or two years of text-book work, and the instructor must devote so much time to teaching separate sections and to administrative work that there is comparatively little leisure for original research or productive work. In the larger institutions ample opportunities are afforded not only for a specialisation of courses on the part of the students, but also for scientific output on the part of the professors. In this respect, however, the American institutions are still in process of transition. There is being built up on the basis of the undergraduate or college department, which gives the degree of A.B., the post-graduate work, which in some places is called the strictly university work, leading to the higher degree of A.M. and especially to that of Ph.D. In such places an increasing share of the attention of the professors is thus being devoted to the post-graduate or strictly university work. In only one institution, *i.e.* Columbia University, is the line drawn at all strictly. Here one-third of the entire force, seven out of the twenty professors, have seats only in the University Faculty of Political Science, and not in the undergraduate or business departments; and their work is confined to strictly post-graduate work. In most of the other great institutions the college still plays so large a part in the whole that a far more considerable share of the instruction is devoted to the undergraduates.

A striking development of the past decade is the creation of schools or faculties devoted to preparation for a business career. These are known by various names—school of commerce, school of commerce and finance, school of business, school of business administration, and the like. They are now found in many of the leading universities. Some limit themselves to so-called undergraduate teaching, some include post-graduate or research work, and one (Harvard) devotes itself solely to graduate instruction. Several of these schools have now started bureaus of research under various names: bureau of business research (Harvard, Illinois, North-western); bureau of industrial research (Pennsylvania).

Another recent development is the creation of bureaus of economic research in general, devoted primarily to the quantitative analysis of economic facts. Some of these, like the Harvard committee of economic research, are connected with the universities; others are independent of the universities and are able to dispose of large resources. Prominent among such bureaus are the National Bureau of Economic Research; the Institute of Economics, the Pollak Foundation, the National Industrial Conference Board, the Institute of Land Economics.

Owing to the great expansion of facilities separate courses are now delivered in most of the leading universities on various detailed questions of economics. These may be classified as follows:—

1. Economic History and History of Economics.—Such are courses, on the one hand, on the financial history of the United States, the industrial history of the United States, the tariff history of the United States, and the economic history of Europe in general and of the various European countries in particular; and, on the other hand, courses on the general history of economics, with special courses on the English economists and the foreign economists.

2. The General Theory of Economics.—Here we find preliminary and advanced courses on general principles, and especially courses on the theories of distribution. Here also belong the various courses on mathematical economics, on the theory of statistics, and on statistical practice.

3. Practical Economic Questions.— Such are courses on agriculture, on money, on labour, on transportation, on trusts, on domestic and foreign trade, on banking, on insurance, on crises, on public finance, and the like.

4. Business Administration.—Here we find courses on private finance, insurance, transportation, business administration and accounting, and on the principles of accounting, private and public.

5. Courses on Sociology and Social Economy. —Among these are courses on the general principles of sociology, problems of social

legislation, of pauperism, of criminology, and the like.

The result is that in the largest institutions sometimes as many as sixty or seventy separate courses are offered.

The instruction for undergraduates is still largely given by means of text-book instruction. For the university work the instruction is almost exclusively by lectures supplemented by the system of "seminars" or special classes of advanced students meeting for research work under the direction of the professor.

The number of students in economics and social science has increased enormously in recent years. The American Economic Association publishes every year a list of the doctors' dissertations which are in progress. According to this list, the institutions having the largest number of advanced students working for a degree during the past few years are in the respective order: Columbia University, University of Wisconsin, Harvard University, Johns Hopkins University, and Cornell University. Several of the Universities also now publish series of studies on economic questions. Among these are the Johns Hopkins University Studies, founded in 1883; Studies of the School of Political Science of Columbia University, founded in 1891; the University of Wisconsin Bulletin, founded in 1904; and the Harvard Economic Studies founded in 1906. Virtually all of the academic teachers of economics are members of the American Economic Association, which has over three thousand members, and which holds annual reunions in various parts of the country. Of recent years the study of economics has also been introduced into the high schools. But the study is limited to the barest elements of the science, and is generally included in what is known as Civics, or a discussion of the framework and fundamental principles of government.

Altogether the outlook for the academic study of economics in the United States has never been so bright as it is at the present time, and the interest is increasing from year to year. E. R. A. S.

ENGEL, Ernst (1821-1896), born at Dresden, began life as a civil engineer, but in 1850 undertook the direction of the newly founded Royal Saxon Bureau of Statistics. In 1858 he resigned this post, and after the death of Dieterici, in 1859, was appointed in 1860 Head of the Prussian Bureau of Statistics, holding the office for twenty-two years, during which period he carried on the work with such energy, that the Bureau, up to that date little known, became a most useful institution of great value to the government and the country in general in all social and economic matters. He also edited a statistical journal and founded a "Statistical Seminary" for students. He retired from the Bureau in 1882, owing partly to disagreement with the government and partly to failing health, but continued to work in retirement. Though brilliant and full of enthusiasm, he was not always a strictly accurate thinker. His principal work was to stimulate and develop the study of statistics.

Among his works are: *Das sächsische Obererzgebirge und seine gewerbliche Bedeutung in Gegenwart und Zukunft*, Dresden, 1855.—"Der Arbeitsvertrag und die Arbeitsgesellschaft" (in the *Arbeiterfreund*, 1867).—"Die Industrie der grossen Städte, eine sozial-statistische Betrachtung" (in the Berlin municipal calendar and year-book, 1868).—*Die industrielle Enquête und die Gewerbezählung im deutschen Reich und im preussischen Staate*, Berlin, 1878.—*Die Gewerbezählung vom i. xii. 1875 und ihre Resultate*, Berlin, 1878. *Deutschlands Getreideproduktion, Brotbedarf und Brotbeschaffung*, Berlin, 1881.—*Das Rechnungsbuch der Hausfrau und seine Bedeutung im Wirtschaftsleben der Nation*, Berlin, 1882. (Vol. xxiv. of the *Volksw. Zeitfragen.*)—*Der Wert des Menschen.* Part 1: *Der Kostenwert des Menschen*, Berlin, 1883. (Vols. xxxvii. and xxxviii. of the *Volksw. Zeitfragen*, forming the first part of a work planned by him in 3 vols. *Domos*, of which nothing further has been published.) In the *Assekuranz-Jahrbuch*, "Ein praktisches Beispiel der Altersfürsorge," 1886, and "Die Tilgung der Erziehungsschuld," 1887.

He published many articles in the *Zeitschrift des Statistischen Bureaus des Königlich-Sächsischen Ministeriums des Innern*: "Der Nutzen der Statistik," 1855;—"Ueber die Bedeutung der Bevölkerungsstatistik mit besonderer Beziehung auf die 1855er Volkszählung im Königreich Sachsen und die Produktions- und Konsumtionsstatistik," 1855.—"Beiträge zur Gewerbegeographie und Gewerbestatistik des Königreichs Sachsen," 1856-1857.—"Der Wohlthätigkeitskongress in Brüssel im September 1856," 1856.—"Der Viehstand auf dem grossen und kleinen Grundbesitz im Königreiche Sachsen, ein Beitrag zur Beantwortung der Frage: Ist die Grosskultur oder die Kleinkultur dem Staate nützlicher?" 1857.

In the *Zeitschrift des königlich-preussischen statistischen Bureaus* he published many articles: "L. A. J. Quetelet, eine Gedächtnisrede, gehalten in der Plenarversammlung des ix. intern. statistischen Kongresses zu Budapest am i. ix. 1876," 1876.—"Wer ist Konsument? Wer Produzent? Zwei international-statistische Fragen, versuchsweise beantwortet," 1879.—He further published in the *Zeitschr. f. d. ges. Staatsw.* 1853, "Die amtliche Statistik und das statistische Bureau im Königreich Sachsen mit einem Blick auf die statistische Centralkommission in Brüssel"—in the *Bulletin de l'Institut internat. de statist.*, vol. ii., Rome, 1887, "Rapport sur la consommation comme mesure de bien-être des individus des familles et des nations";—vol. ix. Rome, 1895-96, "Die Lebenskosten belgischer Arbeiterfamilien früher und jetzt. Ermittelt aus Familienhaushaltrechnungen und vergleichend

zusammengestellt." A number of important German old statistical writings were collected by Engel and published in the *Compte rendu* of the ix. International Statistical Congress (Budapest, 1876-78).

[See *Economic Journal*, vol. vii., London, 1896.—*Handwörterbuch der Staatswissenschaften*, giving a complete list of his works, vol. iii. 1900.]

ENGELS, FRIEDRICH (1820-1895), born at Barmen, Rhenish Prussia, died in England, where he had lived for many years. The son of a wealthy cotton manufacturer, he was connected with the business for a considerable part of his life. In his economic activity he was closely associated with Karl MARX, and his most important work was his assistance in the publication of the second and third parts of *Das Kapital* by that author, of which only the first part had appeared during the life of Marx. The readers of that book will recognise how greatly it is indebted to Engels for being issued in an intelligible form. The *Communistic Manifesto* of 1848 was written by the two friends. Several of the works of Engels are published in English.

"Umrisse zu einer Kritik der Nationalökonomie," in the *Deutsch-französischen Jahrbüchern*, 1844, and again in the *Neue Zeit*, vol. ix., 1890-91.—*Die Lage der Arbeitenden Klasse in England*, Leipzig, 1st ed. 1845, reprint, Stuttgart, 1892. Translated into English, *The Condition of the Working Classes in England in 1844*, New York, 1887, with a preface and appendix, the latter published separately as *The Working Class Movement in America*, New York, 1887; London, 1888; in German as *Die Arbeiterbewegung in Amerika*. — "Einleitung über Freihandel," a speech delivered in Brussels, 1849, translated into English, "K. Marx, Free Trade," Boston and London, 1889.—*Die preussische Militärfrage und die deutsche Arbeiterpartei*, Hamburg, 1865. —*Der deutsche Bauernkrieg*, 1875.—*Zur Wohnungsfrage*, 3 vols., Leipzig, 1872; Zurich, 1887. —*Soziales aus Russland*, Leipzig, 1875.—*Die Entwickelung des Sozialismus von der Utopie zur Wissenschaft*, Berlin, 1891.—*Der Ursprung der Familie des Privateigentums und des Staats*, 1894.—From the *Neue Zeit*: "Ueber den Bürgerkrieg in Frankreich," vol. ix., 1890-91. — "In Sachen Brentano contra Marx wegen angeblicher Citatsfälschung," vol. ix., 1890-91.—"Marx und Rodbertus," vol. iii., 1885.—"Der Sozialismus in Deutschland," vol. x., 1891-92.—"Ueber historischen Materialismus," vol. xi., 1892-93.—"Die Bauernfrage in Frankreich und Deutschland," vol. xiii., 1894-95.—Besides his work with Marx mentioned above (Marx, *Capital*, revised and edited by F. Engels, translated into English by Moore and Aveling, London, 1887), he also assisted him in the following works, writing prefaces, introductions, etc.,—introduction to *Vor den Kölner Geschwornen 1849*, 1885;—introduction (on the history of the "Bundes der Kommunisten") to *Enthüllungen über den Kölner Kommunistenprozess 1851*, 1885;—introduction to *Lohnarbeit und Kapital*, 1891;—note on Brentano in *Kapital*, vol. i., 1890; —and note on Rodbertus in vol. ii., 1885;—note on Rodbertus in *Das Elend der Philosophie*, 1885, —also introd., with biography of the author and history of the Prussian peasantry, to Wolff's *Die Schlesische Milliarde*, 1886;—introduction, with biography of author, to Borkheim's *Zur Erinnerung an die deutschen Mordspatrioten*, 1888.

[See *Handwörterbuch der Staatswissenschaften*, with complete list of his works, vol. iii., Jena, 1900.]

ENGINEERING AND ALLIED INDUSTRY AGREEMENTS. An agreement, mutually adjusted from time to time by representatives of the employers and workers, has secured for the engineering industry during the past twenty-six years comparative immunity from serious labour troubles. Stoppages of work have certainly taken place, some of them over difficulties which appeared to be insurmountable, but in the end the main principle on which the original agreement was founded always remained intact.

The original agreement was made in 1898, after a prolonged stoppage which involved members of the Amalgamated Society of Engineers and other unions, the more important of which are now, with the A.S.E., the component parts of the Amalgamated Engineering Union. The negotiators on behalf of the employers were the Engineering Employers' Federation, which subsequently became the Engineering and the National Employers' Federations and is now the Engineering and Allied Employers' National Federation. It was entitled "Conditions of Management Mutually Adjusted and Agreed upon between the Federated Engineering Employers and the Allied Trade Unions," and contained eight clauses including, at the beginning, a formal assertion of the right of the employers to freedom of management, and at the end "Provisions for Avoiding Disputes."

It was agreed that employers should be free, if they chose, to employ any man whether he belonged to a Trade Union or not; that piecework should be permissible at prices "fixed by mutual arrangement between the employer and the workman or workmen who perform the work"; that overtime should be restricted to forty hours per man per four weeks except in certain specified circumstances which were assumed to justify no restriction at all; that there should be no limitation in the number of apprentices; and that the employers should "have the right to select, train, and employ those whom they consider best adapted to the various operations carried on in their workshops and to pay them according to their ability as workmen." The last of these provisions was a mutual finding of the parties on what is known as the machine question.

Far and away the most important part of the agreement was contained, however, in the

"Provisions for Avoiding Disputes," the effect of whose operation has been to stabilise the relations of employers and employees, and at the same time to conserve the funds and increase the membership of the Trade Unions. These provisions were in the original agreement as follows :—

"With a view to avoid disputes in future, deputations of workmen will be received by their employers, by appointment, for mutual discussion of questions, in the settlement of which both parties are directly concerned. In case of disagreement the local Associations of Employers will negotiate with the local officials of the Trade Unions.

"In the event of any Trade Union desiring to raise any question with an Employers' Association, a meeting can be arranged by application to the Secretary of the Employers' Local Association to discuss the question.

"Failing settlement by the Local Association and the Trade Union of any question brought before them, the matter shall be forthwith referred to the Executive Board of the Federation and the Central Authority of the Trade Union ; and pending the question being dealt with, there shall be no stoppage of work, either of a partial or general character, but work shall proceed under the current conditions."

In October 1907 this agreement was revised. Amongst the changes made was a reduction of the permissible overtime from forty hours per man per four weeks to thirty-two hours per man per four weeks, the specified circumstances in which there was to be no restriction remaining as before. The substance of the claim relating to the non-limitation of the number of apprentices was retained, but the Unions were conceded the right—if they desired to exercise it—"to bring forward for discussion the proportion of apprentices generally employed in the whole federated area."

Much the same course was followed in the redrafting of the provision for the manning of machine tools. The employers, however, undertook to "recommend to their members when they are carrying out changes in their workshops which will result in displacement of labour, that consideration should be given to the case of the workmen who may be displaced with a view, if possible, to retaining their services on the work affected, or finding other employment for them."

The principle of the "Provisions for Avoiding Disputes" was retained. But it was agreed, in addition, to be "competent for an official of the Trade Union to approach the Local Secretary of the Employers' Association with regard to any such question, or . . . for either party to bring the question before a Local Conference to be held between the Local Association of Employers and the Local Representative of the Trade Unions." The provisions were speeded up by fixing time limits for the holding of both Local and Central Conferences, and paragraphs were added stipulating how conferences should be constituted. To the "Provisions for Avoiding Disputes," as amended, several other organisations, including the Electrical Trades Union, subsequently became parties.

Early in 1914, the main agreement was determined so far as the Amalgamated Society of Engineers was concerned, other Trade Unions parties to the agreement intimating their desire for revision. In another arrangement, arrived at in April of that year, between it and the Engineering Employers' Federation, the main principles of the "Provisions for Avoiding Disputes" were reaffirmed. The provisions were further speeded up by shortening the time limit for local conferences and arranging for a central conference once a month.

Following on a dispute early in 1922, the Employers' Federation arrived at agreements in June 1922 with practically all the Trade Unions having members employed in the Engineering and Allied Industry.

In these agreements the general principle that the Employers have the right to manage their establishments and the Trade Unions have the right to exercise their functions is reaffirmed.

The procedure for dealing with questions arising is also provided for. In the case of (1) general alterations in wages, (2) alterations in working conditions which are the subject of agreements officially entered into, and (3) alterations in the general working week, such alterations shall not be given effect to until the appropriate procedure between the Federation and the Trade Union or Unions concerned has been exhausted. It is further provided that where any alteration in the recognised working conditions other than those specified contemplated by the management of a firm will result in one class of workpeople being replaced by another in the establishment, the management shall, unless the circumstances arising are beyond their control, give the workpeople directly concerned, or their representatives in the shop, not less than ten days' intimation of their intention and afford an opportunity for discussion, if discussion is desired, with a deputation of the workpeople concerned and/or their representatives in the shop. Should a discussion not be desired, the instructions of the management shall be observed and work shall proceed in accordance therewith. Should a discussion take place, and no settlement be reached at the various stages of procedure which are possible within the time available, the management shall, on the date intimated, give a temporary decision upon which work

shall proceed pending the recognised procedure being carried through.

The recognised procedure is shortly stated as follows:

1. Discussion between Management and workmen directly concerned.

2. Failing settlement discussion between deputations of workmen accompanied by their Organising Official and the Management accompanied by a Representative of the Federated Association.

3. Failing settlement discussion in Local Conference between Representatives of the Federated Association and Local Representatives of the Society concerned, and

4. In the event of no agreement at Local Conference discussion in Central Conference between the Executive of the Federation and the Executive of the Society concerned.

It is important to note that until the foregoing procedure has been carried through no stoppage of work, either of a partial or a general character, shall take place.

The agreements of June 1922 provide also for the recognition of shop stewards and institution of Works Committees.

Working conditions are the subject of separate agreements between the Federation and the Trade Unions, *e.g.* forty-seven hours working week; overtime and night-shift conditions; holidays; general principles to be observed in regard to systems of payment by results.

[See ARBITRATION BETWEEN EMPLOYERS AND EMPLOYED; CONCILIATION, BOARDS OF; CONSEILS DE PRUD'HOMMES; EMPLOYERS AND EMPLOYED; INDUSTRY, CAPTAINS OF; LABOUR AND CAPITAL; STRIKES; TRADE UNIONS; and also COPARTNERSHIP (above); TRADE UNIONS AND STRIKES; UNEMPLOYED, in Appendix to Volume III.]

ERROR, LAW OF.* The additional references appended to the article on AVERAGE are almost equally relevant to the present subject. The paper on "Observations and Statistics" in the *Transactions* of the Cambridge Philosophical Society, which was mentioned in the original article on AVERAGE, has been supplemented by a paper on the "Law of Error" in the *Transactions* of the said Society 1905, and a paper on the "Generalised Law of Error" in the *Journal of the Royal Statistical Society*, 1906. The application of the law to sampling is well illustrated in Bowley's Presidential Address to the British Association, 1906, reprinted in the *Journal of the Statistical Society*. The use of the law to test whether an observed difference between averages is significant of a real difference, or only accidental, is now largely practised by statisticians. But not much use has been made of the suggestion put forward in 1885 in two papers referred to in the preceding article, to the effect that in dealing with rates (ratios), in the concrete and outside the sphere of simple games of chance ("Bernouilli's theory not being applicable") recourse should be had to the Law of Error in the more general form which is applied to magnitudes other than ratios. F. Y. E.

EXPORTS, INVISIBLE. The large excess of imports over exports in the trade of this country has long been a subject of remark. How can the difference between these two sets of figures be accounted for?

The figures of recent years are as follows:—

	Total Imports.	Total Exports.	Excess of Imports.
	£	£	£
1900	523,000,000	354,000,000	*169,000,000*
1901	522,000,000	348,000,000	*174,000,000*
1902	528,000,000	349,000,000	*179,000,000*
1903	543,000,000	360,000,000	*183,000,000*
1904	551,000,000	371,000,000	*180,000,000*
1905	565,000,000	408,000,000	*157,000,000*
1906	608,000,000	461,000,000	*147,000,000*
1907	646,000,000	518,000,000	*128,000,000*
1908	593,000,000	457,000,000	*136,000,000*
1909	625,000,000	470,000,000	*155,000,000*
1910	678,000,000	534,000,000	*144,000,000*
1911	680,000,000	557,000,000	*123,000,000*
1912	745,000,000	599,000,000	*146,000,000*

The excess of the imports over the exports of the United Kingdom was larger in 1900 than in any year previous. This excess increases in the main progressively. To understand the real meaning of the phenomenon, we have, in the first place, to remember that while the value of the imports is correctly stated, the value of the exports is necessarily largely understated. The figures of the cost of the exports are taken from the declarations made either by the owner of the goods or the agent who forwards them for shipping abroad. It can neither include the profit which the exporter expects to make, nor the whole cost of conveying the goods to their destination. Into these heads many items are brought which few people unconnected with business are ever aware of. The cost of freight and agency is very large. Ships are very perishable. They become rapidly out of date; they require constant repair. The payment for freight provides, among other things, practically the cost of the construction, maintenance, and navigation of those powerful lines of enormous steamers which connect this country with the rest of the world. Sir R. GIFFEN, who gave the amounts received in this manner the name of "Invisible Exports," about 1904 estimated these in the form of earnings of ships, commissions, and brokerage as not less than £100,000,000 a year.

Besides these amounts which do not appear in our ordinary statistics, there are the pay-

ments of the annual interest due on the capital which was exported many years back and invested abroad. These are estimated as being some £60,000,000 a year. We need not pursue the subject further into detail, but we think that enough has been said to explain that the difference between the amounts of our exports and imports which occasionally puzzles the untrained reader of the official statistics of the trade of the country is largely a matter of account.

Sir R. Giffen, *Essays in Finance*, First Series 1880, Second Series 1886; Bell. — *Economic Inquiries and Studies*, two vols., 1904, Bell.

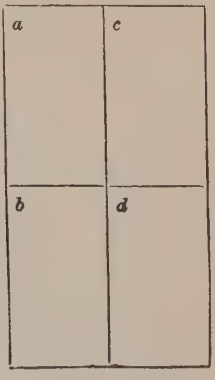
Names of persons noticed in the Dictionary appear, in the index, in small capitals, as J. S. MILL: titles of other articles in heavy type, as Value; foreign words, not being titles of articles, and names of books, in italics, as *Villa*, *Wealth of Nations*. A colon indicates the end of the index-heading: individual references are separated by a semicolon; groups of references by .——

* An asterisk signifies that the article is in two parts, of which one is in the Appendix.

In each reference the number indicates the page, while the letter indicates a *division* of that page; *a* and *b* referring to the *upper* and *lower* halves of the *left*-hand column, *c* and *d* to the *upper* and *lower* halves of the *right*-hand column. Thus, Absentee: Evils of, 3 *d*, refers to page 3, the lower half of the right-hand column. The diagram subjoined shows the method followed:—



INDEX

Absentee: Evils of, 3 *d*, 4 *a*; income remitted by **Exports**, 3 *b*; J. R. M'CULLOCH on, 3 *c*, 623 *d*, 624 *a*; and **Middleman**, 3 *d*; J. S. MILL on, 3 *bc*; F. QUESNAY on, 3 *c*; W. N. SENIOR on, 3 *b*, 4 *a*.

Abstinence: and econ. **Harmonies**, 4 *d*; element in **Profit**, 4 *d*; effect on **Value**, 761 *d*.

Abstract Method: T. CARLYLE on, 228 *a*; compd. with Concrete, 5 *c*; **Dutch Sch.**, 657 *c*; J. S. MILL on, 5 *b*, 734 *d*.

Accumulation: J. RAE on effective desire of, 592 *cd*; Rate of, causes affecting, 7 *b*.

ADAMS, H. C.: 799 *a*-800 *c*, 809 *d*.
